PRESENT MEMBERS OF THE BOARD OF TRUSTEES OF THE FOUNDATION FOR THE FUTURE OF BIOMEDICAL SCIENCES IN SZEGED

ANDRÁS VARRÓ

CHAIRMAN OF THE FOUNDATION'S BOARD OF TRUSTEES

Doctor of Hungarian Academy of Sciences (HAS), Professor of the Department of Pharmacology and Pharmacotherapy at the Faculty of Medicine, University of Szeged

PÉTER HEGYI

SECRETARY OF THE FOUNDATION'S BOARD OF TRUSTEES

Doctor of HAS, Professor of the Faculties of Medicine, Universities of Szeged and Pécs

GYÖRGY LÁZÁR

Doctor of HAS, Dean of the Faculty of Medicine, University of Szeged

LÁSZLÓ DUX

Doctor of HAS, Professor of the Department of Biochemistry at the Faculty of Medicine, University of Szeged

LAJOS KEMÉNY

Doctor of HAS, Professor and Head of the Department of Dermatology and Allergology

SZILVIA KRIZSÓ

Pulitzer Prize-winner television journalist

FERENC NAGY

Academician, Director general of the Biological Research Center, Szeged

LÁSZLÓ VÍGH

Academician, research professor of the Biological Research Center, Szeged

PREVIOUS MEMBERS OF THE BOARD OF TRUSTEES OF THE FOUNDATION
FOR THE FUTURE OF BIOMEDICAL SCIENCES IN SZEGED

ISTVÁN LEPRÁN

Doctor of HAS, representative of the Dean of the Faculty of Medicine,
University of Szeged, 2013–2014

LÁSZLÓ VÉCSEI

Academician, former Dean of the Faculty of Medicine, University of Szeged, 2013–2014

FERENC BARI

Doctor of HAS, Dean of the Faculty of Medicine, University of Szeged, 2014-2018

PÁL ORMOS

Academician, Director general of the Hungarian Academy of Sciences
Biological Research Center, Szeged 2013-2018

PROFESSIONAL MANAGEMENT

BERT SAKMANN

DIRECTOR OF EDUCATION

Nobel Laureate cell physiologist, Max Planck Institute für Neurobiologie, Munich

PÉTER HEGYI

PROGRAM DIRECTOR

Doctor of HAS, Professor of the Faculties of Medicine, Universities of Szeged and Pécs

ANDRÁS VARRÓ

CHAIRMAN OF THE FOUNDATION'S BOARD OF TRUSTEES

Doctor of HAS, Professor of the Department of Pharmacology and Pharmacotherapy at the Faculty of Medicine, University of Szeged

SÁNDOR BÁN

DEPUTY DIRECTOR (SECONDARY SCHOOL EDUCATION)

Leading biology teacher at Radnóti Miklós Experimental Grammar School, Szeged

ZOLTÁN RAKONCZAY

DEPUTY DIRECTOR (UNIVERSITY EDUCATION)

Doctor of HAS, Professor and Head of the Department of Pathophysiology at the Faculty of Medicine, University of Szeged

NATIONAL BASE SCHOOLS

RADNÓTI MIKLÓS EXPERIMENTAL GRAMMAR SCHOOL SZEGED

HEADMASTER: DR. ANETT NAGY

DEPUTY LEADER OF THE LABORATORY: ANDREA BORBOLA *(See page 14)*

The Radnóti Miklós Experimental Grammar School of Szeged saw many profile changes throughout its 120 year old history. Originally named after Gábor Klauzál, it served as a boys' real school for Szeged's middle class. After the second World War a mixed education was introduced, adding the training of skilled workmanship next to the real school. The current general gymnasial profile – aiming to achieve scientific excellence – was gradually built up starting from 1957. The school's building is as old as the institute itself, historically decorated yet equipped with state of the art laboratories and ICT appliances. At the moment six different departments are operated: Mathematics-Physics, Chemistry, Biology, Mathematics, General Studies (with increased English or Spanish classes), Humanities and a talent care division focusing on students with underprivileged backgrounds.

The students achieve the best results in Mathematics and Sciences. The average grades of the final examinations and the number of students accepted to universities both mark efficiency of the education and talent care. It is also known that not many schools can exceed the 'Radnóti' when it comes to results at national and international competitions. While the faculty is proud of the students' achievements, they consider these competitions as a means of education, not as a main goal. During the preparation the students can learn confidence, persistency, self-knowledge and cooperation next to the professional knowledge. Hence the school's motto: 'Sapere aude' – 'Dare to know'.

The construction of the Specialized Laboratory for Scientific Education (TERMOSZ Laboratory) was finished in 2015. The laboratory is located at the school's area yet plays a central part in the renewal of scientific education collaborating with 18 other schools in the Szeged school district. The associates also help with the preparations and executions of international competitions, in addition they play a key role in the national biological talent care.

NÉMETH LÁSZLÓ SECONDARY AND GRAMMAR SCHOOL – HÓDMEZŐVÁSÁRHELY

HEADMASTER: LÁSZLÓ ÁRVA

LABORATORY LEADER: EDIT CSALÁNY BÖNGYIK (See page 14)

Németh László Secondary and Grammar School was established in the 1980s to serve the Hódtó district of Hódmezővásárhely. Originally it was a minor elementary school, however it launched its gymnasial classes in 1995 which quickly helped to raise its ranks amongst the other high schools of the town. Besides the general gymnasial educational structure, the school also emphasizes language and IT (Information Technology) studies along with natural science.

It is an absolute advantage that the students can carry out their studies in one institute – the talent care and education starting from early age until their final examination. This counts as a unique feature in Hungary and it helps to maintain a smooth cooperation between the elementary and high school educators, helping out the long-term correction and design of the training plan. The students have proven themselves at several competitions and perform well on their final examinations – marking the good student-teacher collaboration.

The school's modern building provides a luminous, well established location and atmosphere to carry out high standard education. In addition, a botanical garden is being built which will be a green spot in the neighborhood.

The József Gyulai Scientific Workshop (József Gyulai Laboratory) was established in 2012, offering quality training with modern equipment. All the neighboring elementary students can use the laboratory under the supervision of its trained attendants.

REGIONAL BASE SCHOOLS

TÓTH ÁRPÁD SECONDARY SCHOOL – DEBRECEN

Headmaster: Amália Fenyősné Kircsi
Szent-Györgyi Senior Teacher: József Gőz (p. 23)

NAGY LAJOS GRAMMAR SCHOOL OF THE CISTERCIAN ORDER – PÉCS

Headmaster: Márta Bodáné Gálosi
Szent-Györgyi Senior Teacher: Zsolt Nyisztor (p. 30)

TEACHING CAREER IN BRIEF

I've been an associate at the TERMOSZ Laboratory since 2014, I consider it as a prime element in my life. During my high school years I had the opportunity of assisting at the Cell Biology and Evolutional Micropaleontology Laboratory of the University of Szeged, which helped me start my scientific work. Throughout my university studies I was co-authoring several English publications, participated in an Indian-Hungarian joint research and for years I was the technical editor of the Plant Cell Biology and Development (Szeged) issue. In addition I also acquired some successful applications (Pro Renovanda Cultura Hungariae Fund – 'Students for Science' foundation).

My interests shifted towards molecular biology - starting from 2001, I carried out my PhD studies at the Genetic Institute of the Biological Research Center (Hungarian Academy of Sciences); later on I worked there as a science assistant. Next to learning the basic molecular biology techniques and elaborating new methods I also participated in several conferences. At the moment I'm teaching Biology at the Radnóti Miklós Experimental Grammar School and tending to the TERMOSZ Laboratory.

EDIT CSALÁNÉ BÖNGYIK

Németh László Grammar School

Address: Ormos Ede u. 18., H-6800 Hódmezővásárhely, Hungary

TEACHING CAREER IN BRIEF

I began teaching in the Commercial and hospitality secondary school of Hódmezővásárhely in 1998, parallel with my university studies and I have been working in the Németh László Grammar School for a year. I have been teaching biology and chemistry and during my years in the commercial secondary school my students performed well at professional competitions. I have always felt lucky to be a teacher, I am one of the few persons whose job is their hobby. I regularly attended professional trainings and always supported varied pedagogical methods and educational

forms, recently I have been committed to digital pedagogy. I was teaching complex nature for a long time, I also prepared a workbook for internal use with my colleague. Thanks to this I became closer to the activities of the Öveges labs and also had the opportunity to participate in the elaboration of complex book labs. I was also engaged in scientific thinking renewing teacher training for two years. I gladly contribute to project writing, I am proud of my two successful National Talent Projects. At present, I teach students committed to natural sciences at each grade above 8th and also the ones who wish to perform advanced level biology final exam.

SZENT-GYÖRGYI SENIOR TEACHERS

“Those who affect children’s
imagination essentially influence
their future existence as well.”

József Eötvös

Szent-Györgyi Senior Teachers are the secondary school teachers who constantly recognise young talents and provide them with additional, extensive knowledge of biology and chemistry. Their students also actively participate in the national and international natural sciences competitions.

Szent-Györgyi Senior Teachers select youths who have the opportunity to get more acquainted with the scientific activities of the Faculty of Medicine at the University of Szeged and the Biological Research Center. The most important tasks of *Szent-Györgyi Senior Teachers* are to introduce the selected youths to the Szeged Scientists Academy’s program, to encourage them to inquire into areas of research supervised by mentors of the Academy, and to emphasize all the potentials to reach the top of their profession with the help of the Academy’s scholarships.

With the assistance of *Szent-Györgyi Senior Teachers*, it is possible to achieve an interconnection between secondary schools and higher education, which then facilitates the development of young talents to become creative, successful scientists.

Currently there are 16 *Szent-Györgyi Senior Teachers* in the program representing a number of schools in different cities all over the country, and their mutual goal is to develop young talents into prominent researchers of Hungarian science.

SÁNDOR BÁN

PROFESSIONAL LEADER OF THE SECONDARY
SCHOOL PROGRAM

Radnóti Miklós Experimental Grammar School Szeged

Address: Tisza Lajos krt. 6-8., H-6720 Szeged, Hungary

TEACHING CAREER IN BRIEF

I started my career in 1993 at the Dugonics András Piarist Grammar School, Szeged, where I taught chemistry and biology, both as part of the regular curriculum and in advanced elective courses as well as special after-school lessons. In 1998–99, I played a leading role in designing and equipping the science section of the school's new building. I was also the head of the department of biology and chemistry for four years. Since 2002, I have taught in the special biology, chemistry and mathematics programs at the Radnóti Miklós Grammar School in Szeged, mostly in small groups. Between 2005 and 2012, I headed the biology department, which developed into the most successful high school biology workshop in the country during that period, based on advanced Matura examination and competition results. My colleagues and I have also established a state-of-the-art high school molecular biology laboratory. This facility has been made available to biology teachers from other schools for in-service trainings as well as to students for selection tests for international biology competitions. My colleagues and I have attended in-service trainings in molecular biology at the EMBL laboratories in Cambridge, Heidelberg and Monterotondo on a number of occasions. Since 2009, I have been the team leader of the Hungarian national teams at the International Biology Olympiad (IBO) and mentor to our national teams at the European Union Science Olympiad (EUSO). In 2010, I won the Rátz Lifetime Achievement Award. I am currently head of the EU-funded high school science laboratory.

JÓZSEF BARANYAI

ELTE Bolyai János Practice Primary and Secondary Grammar School

Address: Bolyai utca 11., H-9700 Szombathely, Hungary

TEACHING CAREER IN BRIEF

I completed my biology degree at the József Attila University (University of Szeged) in 1994. During my university years, I was a demonstrator at the Department of Zoology, and I stayed on as an assistant lecturer after receiving my degree. I have much to thank the excellent staff at the department (Drs. Róbert Gábor, Éva Fekete and Katalin Halasi) for my professional development. They inspired me to become an outstanding student and assistant lecturer. Soon afterward, I was invited by János Iker to the newly established Bolyai Grammar School in Szombathely and have been teaching there since then for over 20 years. I am an advocate of problem-/inquiry-based learning, but also believe that there is not one single right method: one must always dynamically adjust to the problem at hand and tailor the methods accordingly. I have worked on a number of professional boards (Hungarian National Institute for Educational Research and Development (OKI/OFI) in curriculum development, dealing with the National Curriculum etc.). I am the head of our talent center, and I am proud of all the results of all my students. In 2011, I received the Rátz Lifetime Achievement Award, and in 2013 the Bonis Bona National Talent Award.

medical student
Semmelweis Medical University, Budapest
• IBO 2013, silver medal

ISTVÁN CSIGÉR

SZTE Primary and Secondary Grammar School

Address: Szentháromság utca 2., H-6722 Szeged, Hungary

TEACHING CAREER IN BRIEF

I earned my degree at the József Attila University (University of Szeged) in 1985, which qualified me to teach biology and chemistry in secondary school. Right after I completed my studies, I started my career at the Vocational School for Forestry and Water Resources Engineering and Management in Barcs, where I spent six years. I taught biology and chemistry to students in the forestry stream and chemistry and lab practice to students in the water resources engineering and management stream. In acknowledgement of my work, I received a Ministerial Commendation in 1989. In 1991, I came to my current workplace, the University of Szeged Grammar School and Primary School (previously the University of Szeged Ságvári Endre Grammar School) as a mentor teacher in biology. My basic job has been to teach biology and to train university students studying to become biology teachers (supervising student teaching and administering examinations to student teachers). I also work as the lead teacher for biology in the Szeged Regional Student Science Laboratory, established by our high school and by the University of Szeged, which supports it financially. Within the limits of reason, I endeavour to develop relationships with my high school and university students based on collegiality and respect, never compromising on quality work standards or the requirements of consistent and rigorous assessment. In acknowledgement of my teaching activities, I received the Golden Rostrum Commemorative Plaque in 2001. I first became involved in the Szeged Scientists Academy in 2012, which honored me with the title of Szent-Györgyi Teacher and then in 2016 with that of Szent-Györgyi Senior Teacher. I have endeavoured to aid the academy from the beginning to discover and cultivate young talent.

JULIANNA ERŐS-HONTI

ELTE Trefort Ágoston Secondary Grammar School

Address: Trefort u. 8., H-1088 Budapest, Hungary

TEACHING CAREER IN BRIEF

I completed my studies as a research biologist at Eötvös Loránd University, Budapest, with a concentration in evolutionary biology, systematics and ecology. Later, at the same institution, I studied in the Theoretical Ecology Program within the Doctoral School for Biology. In the meanwhile, I also earned a teaching degree. I conducted my research in the field of plant ecology, examining the distribution of grass species in the Dolomites. In my research work, I gained experience in planning research. I can thus assist students in carrying out independent research and writing articles. I taught biology at Fazekas Mihály Primary and Grammar School for 8 years. Here I gained experiences in nurturing excellence, preparing students for competitions, as well as in giving demonstrative lessons. Actually, I work in the ELTE Trefort Ágoston Grammar School, where I also mentor candidate teachers in addition to the above mentioned tasks. A great emphasis is placed on academic competitions at our school, for which we continuously prepare our students. I consider my most significant tasks to be the special after-school lessons for nurturing excellence and the summer biology camps that I organise, in which our students can become acquainted with the mentality of the researcher and the diversity of the academic field. In addition to teaching, I have worked as an educational developer for the Hungarian National Institute for Educational Research and Development (OFI), and I also contribute to the work of the Matura examination, as assigned by the Office of Education.

ZSOLT ERŐS-HONTI

Fazekas Mihály Primary and Secondary Grammar School

Address: Horváth Mihály tér 8., H-1082 Budapest, Hungary

TEACHING CAREER IN BRIEF

I am a research biologist with a PhD as well as having been trained as a specialized translator and secondary school biology teacher. For several years I had been working as an active researcher at the Faculty of Horticultural Science, Szent István University. Ever since I received my teaching degree, I have been teaching biology to secondary school students (both in Hungarian and English). I participate in the nurturing excellence program at the school, preparing students for both domestic and international competitions, including the International Biology Olympiad. I also organise camps and prepare students for the Matura examination. I have developed teaching materials for public education, edited and published educational methodology coursebooks, and provided professional editing for materials used in public education. I participated in a Social Renewal Operational Program (TÁMOP) project dealing with the implementation of the framework curriculum in the Hungarian National Institute for Educational Research and Development (OFI), and I was also a member of a working group that harmonised the requirements of the Matura examinations with those of the framework curriculum. Since 2012, I have regularly completed assignments for the Office of Education. Currently, I am working as a biology teacher and vice principal at the Fazekas Mihály Primary and Grammar School of Budapest. As someone previously involved in higher education, it is my conviction that development and nurturing excellence should not be a process tied to particular educational phases. It should be an overarching effort. I am also convinced that success in the education system depends on effective communication between public and higher education.

NORBERT FARAGÓ

ELTE Trefort Ágoston Secondary Grammar School

Address: Trefort u. 8., H-1088 Budapest, Hungary

TEACHING CAREER IN BRIEF

I began my teaching career at the Terézváros Bilingual Primary and Grammar School in Budapest in 2001. I also taught biology and chemistry at a private grammar school concurrently. Since 2005, I have taught at the Trefort Ágoston School in Budapest, mostly biology. I have been a mentor teacher since 2006. In 2010, I received a certificate in mentoring candidate teachers. At school, I teach seventh- to twelfth-grade students as well as preparing the eleventh- and twelfth-grade students in advanced elective courses. Our students have achieved strong results at the Herman and Kitaibel competitions as well as at the National Secondary School Competition (OKTV) and the Árokszállás biology and environmental protection competition. I regularly prepare students in groups for the advanced Matura examination. Since 2013, I have been head of the school's TÁMOP-funded science laboratory.

ANDREA FAZAKAS

Deák Téri Lutheran Gymnasium

Address: Ősz utca 18., H-2100 Gödöllő, Hungary

TEACHING CAREER IN BRIEF

I graduated with a secondary school teaching degree in biology and chemistry at József Attila University (University of Szeged) in 1988. I began teaching at the Deák Téri Lutheran Grammar School in Budapest in 1993. I quickly learned the importance of an encouraging school atmosphere in nurturing talented students. I developed Matura examinations for the Hungarian National Institute for Educational Research and Development (OFI) between 2003 and 2006. In 2004, I attended a Training for Trainers program to implement the two-tier Matura examination, and in 2004–05, I held talks on this new system for my colleagues. I have also participated in administering the advanced Matura examination since 2005. Meanwhile, in 2005, I passed a qualifying examination to become a mentor teacher at the Faculty of Sciences, Eötvös Loránd University, Budapest. I have always been happy to mentor future teachers. I have seen five of my candidates complete their teacher training. I received the BONIS BONA for the Nation's Talent Award in 2013 in acknowledgement of my efforts in preparing students for the National Secondary School Competition (OKTV). In 2015, I applied for the master teacher rank and received it the following year. I consider it important during my work to instil a passion for biology in my students and introduce them to the logic of the natural sciences. Various extracurricular events offer excellent opportunities in that regard. During the academic year, we usually take hiking trips, mainly in the Danube–Ipoly National Park (DINP). In addition, we also visit laboratories and attend lectures organised for students by the Hungarian Academy of Sciences. During the summer holidays, I take my students to one-week ecocamps. We have already visited the Kis-Balaton, Szatmár, Őrség and Lake Velence regions in and around Hungary as well as the North Hungarian Mountains.

JÓZSEF GŐZ

Tóth Árpád Secondary School

Address: Szombathi István u. 12., H-4024 Debrecen, Hungary

TEACHING CAREER IN BRIEF

I have been teaching biology and chemistry at the Tóth Árpád Grammar School in Debrecen since 2000. During my career, I have earned a qualification in specialized Hungarian–English translation as well as passing a mentor teaching examination and receiving the title of master teacher. At my job, in addition to teaching in the specialized biology program, I also joined the Arany János Nurturing Excellence Program, the International Baccalaureate Program and the Öveges Scientific Laboratory Program, as well as being involved in grant projects and in mentoring candidate teachers. In our school we are engaged in a specialized high school program for Biology and Chemistry that enjoys the longest history in the country. An integral part of this is nurturing excellence, developing projects, and preparing students for competitions and the Matura examinations. As a Matura examiner, I operate an online database which aids in the students' preparations for the examination with items on the written part presented in a system. My main area of interest and research is the methodology of teaching biology and, within that, digital innovation. In my work, I do my best to combine the facilities of ICT and the international environment with the traditional values embodied by my workplace and the domestic professional community. In 2018, I was awarded the Szent-Györgyi Trophy by the University of Szeged, and the MESTER-M award by the MOL Foundation.

ZSOLT HORVÁTH

Gödöllő Reformed Secondary School

Address: Szabadság tér 9., H-2100 Gödöllő, Hungary

TEACHING CAREER IN BRIEF

I received my teaching degree in biology and chemistry from the Kossuth Lajos University (University of Debrecen) in 1995 and have been working since then at the Reformed Church Grammar School in Gödöllő. During the first years of my career, I learned about the BISEL biological water quality assessment method, and in 2000 I participated in the Bioindication and Internet 2000 EU Leonardo in-service training for teachers in Belgium. Then in summer 2002, I organised the BISEL bioindication water quality assessment method 2 accredited in-service training. Between 2006 and 2008, I was asked to update high school biology coursebooks written by Gábor Lénárd and published by Nemzeti Tankönyvkiadó publishers. My tasks included editing (the Prizma series written by Mrs József Berger), preparing digital teaching materials (a CD-ROM with images, figures and experiments for the Lénárd biology coursebook series) and holding lectures (at the start-of-the-year Nemzeti Tankönyvkiadó conference). I have participated in designing biology competition items since 2008. Between 2011 and 2012, I edited digital teaching materials for chemistry and biology called Yenka and Sunflower, and I prepared a series of histological images for Mozaik Publishers. In 2015, I edited digital teaching materials entitled "The molecular cell biology of autolysis, apoptosis and cell regeneration", created by the Department of Anatomical, Cell and Developmental Biology, Eötvös Loránd University, and took part in a training for trainers on the advanced Matura examination in biology. As of 2016, my school (along with three other Hungarian high schools) has participated in a health protection program based on the TANTUDSZT contemporary teaching project, which won a teaching methodology competition announced by the Hungarian Academy of Sciences. In 2016, I had three articles published in the Eduvital column of Élet és Tudomány (Life and Science), a popular science weekly.

ZOLTÁN JÁNOS KERÉNYI

**Premonstratensian St. Norbert Secondary School,
Technical School for Church Music and Dormitory**

Address: Takács Menyhért út 2., H-2100 Gödöllő, Hungary

TEACHING CAREER IN BRIEF

I earned a degree from the József Attila University (University of Szeged) as both a biology teacher and a biologist with a specialization in ecology. I began my teaching career as a part-time biology teacher at the Dugonics András Piarist Grammar School in Gödöllő, moving on to the Premonstratensian (Norbertine) Grammar School in the same town in 1998. I taught biology to students within the regular curriculum and advanced elective courses in biology for those preparing to study the subject at university as well as other enthusiasts. We launched a specialized program in biology and chemistry in 2014–15, and, as department head, I played an active role in developing its content and structure. Since our school boasts a great many outstanding students, my teaching activity has become focused on engaging with young people with particular talent. In order to carry out the work in a truly professional manner, I also completed a course to become a talent development teacher at the University of Debrecen and attended the Geniusz in-service training ("Nurturing excellence among talented biology students"). One regular, favourite form of dealing with talented young people is the Path to Science program, through which research teams of five students are formed to learn and improve thinking through joint research activity on a particular topic area. At the end of the project, the research teams share their results in a presentation every year at the TUDOK regional and national conferences. For my work in nurturing excellence, I have so far received the Kontra György Award (2010), Bonis Bona Award (2013), a Ministerial Certificate of Recognition (2016) and the Pro Progressio Award.

RÓBERT KERTÉSZ

Táncsics Mihály Secondary Grammar School of Kaposvár

Address: Bajcsy-Zsilinszky utca 17., H-7400 Kaposvár, Hungary

TEACHING CAREER IN BRIEF

I earned my secondary school teaching degree in biology and chemistry at the József Attila University (University of Szeged) in 1993. I started working at the Department of Botany there and then moved to Kaposvár in 1997. Since then, I have been teaching biology and chemistry in the regular and specialized curricular programs at my alma mater there, Táncsics Mihály Grammar School. Since the Research area of the two-tier Matura examinations, I have participated in the work of the advanced Matura examination boards, I have corrected advanced written Matura examinations and was even requested to oversee examination marking. I passed two specialized examinations (at the University of Szeged and the Budapest University of Technology and Economics) and have incorporated the knowledge I have thus acquired into my everyday practice. In 2014, I received the rank of master teacher, so I am now also called on to provide consultations, through which I endeavour to improve the position of my scientific subjects, which are continually being pushed into the background. During my work in secondary school, I have always laid great stress on nurturing excellence – I have prepared my students for various competitions in both of my subjects. I consider it important to aid my students in strengthening their own innate interest and developing their own high professional standards.

BEATRIX CSILLA BAGI KERTÉSZ

Táncsics Mihály Secondary Grammar School of Kaposvár

Address: Bajcsy-Zsilinszky utca 17., H-7400 Kaposvár, Hungary

TEACHING CAREER IN BRIEF

I earned my teaching degree in biology and chemistry at the József Attila University (University of Szeged) in 1993. I rounded out my degree with a postgraduate qualification in environmental protection in 1995. I taught at the Corvin Mátyás Vocational School in Hódmezővásárhely for four years, and I have been teaching in my current workplace at the Táncsics Mihály Grammar School in Kaposvár since 2001. Throughout my career, I have placed a major emphasis on nurturing excellence in my professional work. My students have achieved success at various competitions in chemistry, biology and environmental protection, many of them having gone on to study medicine, pharmacy, biology and chemistry. I teach advanced elective courses in both my subject areas, and I was the form teacher for three of the groups in the school specializing in biology and chemistry as well as their teacher in those subjects. I have aided my students with a great deal of useful experience by regularly participating in the advanced Matura examinations in both of my subjects. I have always considered it important to learn about and apply an objective measurement of knowledge. I therefore did a specialized examination in teaching with a specialization in educational assessment at the University of Pécs in 2011. I feel responsible for the future of my academic subjects. My aim is for us to engage in a truly appealing science education in our schools at a high standard, an effort I strive to support as a consultant with a master teacher qualification. Finally, I think one needs sufficient professional humility and endurance to be successful in one's work, not only talent.

ELTE Trefort Ágoston Secondary Grammar School

Address: Trefort utca 8., H-1088 Budapest, Hungary

TEACHING CAREER IN BRIEF

I started my teaching career in autumn 2002 at the Eötvös Loránd University Trefort Ágoston School in Budapest, where I have worked ever since. I have trained candidate teachers as a mentor teacher in chemistry there for nine years, and I have been department head since 2011. As a form teacher, I will see my second group of students complete their Matura examinations. In 2010, I received the Trefort Ágoston Certificate of Recognition from the Eötvös Loránd University Senate. In the same year, I was certified as a mentor teacher with a specialization in nurturing excellence. My goal is to shed light on the beauty and importance of scientific connections and their close ties to our everyday lives. I lay a great deal of emphasis on mentoring talented students in special after-school lessons. Two of my students have reached the National Secondary School Competition (OKTV) finals in biology and two have done so in chemistry. One of my students became a member of the national team for the International Mendeleev Chemistry Olympiad.

ADRIEN LENGYEL

Calvinist Grammar School of Kecskemét

Address: Szabadság tér 3/a, H-6000 Kecskemét, Hungary

TEACHING CAREER IN BRIEF

Being a student at the József Attila University of Szeged, I concluded my studies as a Biology and Chemistry teacher. My first employment was at the Katona Secondary School at Kecskemét, then I changed to the Calvinistic Secondary School where I'm working up to this day. Upon launching the six-grade education program, my task was to develop the Chemistry curriculum, later I became the head of the teacher's team. We are frequent participants of the TUDOK (Annual Conference of National Scientific Students' Associations) with remarkable success. The achieved results truly enhanced my personal development. Along with a colleague, I'm organizing the Biology field trips which are quite popular amongst our students. I'm also an evaluating teacher at the advanced level final examinations. Throughout the years my main focus has been to modernize Biology education; especially reaching out for students who show interest in this field - for this achievement I received an award. Other significant professional steps were publishing textbooks and books assisting the preparation for final examinations (MAXIM publishing). These activities demand great devotion, lots of reading, consulting and many working hours, yet offer the best way for self-improvement in the dynamically changing subject of Biology. In addition, I handled full readership of a laboratory project and held advanced education to my colleagues. I find these activities both challenging and exciting.

ZSOLT NYISZTOR

Nagy Lajos Grammar School of the Cistercian Order

Address: Széchenyi tér 11., H-7621 Pécs, Hungary

TEACHING CAREER IN BRIEF

I received my teaching degree in biology and chemistry at the University of Pécs. During my studies, I was engaged in an ecological study of barn owls, among other topics, as well as a molecular biology project involving the processing of samples collected in the field for taxonomic purposes. During this time, I also spent half a year in Italy as an ERASMUS student at the University of L'Aquila. In 2001, I began teaching at the Nagy Lajos Cistercian Grammar School in Pécs, where I have been a teacher ever since. I graduated from the Doctoral School of Biology and Sportbiology of University of Pécs in 2019. I studied the development of the mammalian retina. I would like to pass on to my students my enthusiasm for the sciences and the ability to wonder at the myriad beauty of the created world. I believe that Hungary should be represented among the scientific elite of the world through diligence and endurance. I consider it important for my students to leave high school not only strengthened in knowledge, but also in moral and spiritual values.

TÜNDE SZALAINÉ TÓTH

Lovassy László Grammar School

Address: Cserhát ltp. 11., H-8200 Veszprém, Hungary

TEACHING CAREER IN BRIEF

I have been an educator since 1982 and continue to derive great joy from my work to the present day. In addition to my daily teaching responsibilities, I have endeavoured to use and pass on my knowledge and experience at the school, municipal, county and national levels. I consider it a priority to nurture excellence: so far, 41 of my students have reached the final round of Hungary's highly respected National Secondary School Competition (OKTV) in biology, two of them won first place, one of them won second place, and 12 of them finished in the top ten. My students have achieved great success in numerous other prominent competitions for young scholars. As an acknowledgement of my work in nurturing excellence, I received both the MOL-Mester-M Award and the Rátz Life Achievement Award as well as a Ministerial Certificate of Recognition. I have also been awarded the Ranolder Prize from the City of Veszprém and the Pro Talento Prize from the Veszprém County Institute of Education. I take part in organising county and national competitions as well as school events. I am a master teacher, consultant, board chair for the Matura examination and multiplier as well as participating in bringing grant projects to fruition. I was a form teacher for 19 years. I enjoy professional challenges, and I have worked as an educational developer in several projects for the Hungarian National Institute for Educational Research and Development (OFI). I have often published in *Élet és Tudomány* (Life and Science), a popular science weekly, in which studies by my students are also occasionally published. I have also created the Lovassy Health website, which is edited exclusively by my students, who write articles on health and health education. At the request of Maxim Publishers, I have prepared a Matura preparation book with a colleague from Debrecen. Since 2014, I have participated in the work of the National Teachers Chamber (NPK) as a national delegate, and I have been the national chair of the Man and Nature section of the Chamber since 2015.

CSILLA SZENTESI

Földes Ferenc High School

Address: Hősök tere 7., H-3525 Miskolc, Hungary

TEACHING CAREER IN BRIEF

I completed my studies in biology and geography at the Kossuth Lajos University (University of Debrecen) in 1998. To this day, I have taught in my former high school, Földes Ferenc Grammar School in Miskolc. In 1998, I also completed a teaching degree in the field of environmental protection at the Eszterházy Károly College in Eger. In 2005, I passed an examination in public school management and teaching. In 1996, I joined the County Institute of Education, and I was appointed a municipal consultant in biology and environmental protection between 1998 and 2011. Since 2005, I have been a board chair for the advanced Matura examination in my subject areas and am also engaged in coordinating the corrections for the advanced written Matura examination. During my career, I have organised lectures and held practical in-service training for my colleagues in the county. I have participated in testing digital teaching materials, preparing task sheets and editing geography coursebooks as well as serving as a mentor teacher for a number of student teachers from the University of Debrecen.

As of 2015, I have also worked as a master teacher and an educational inspection and teacher certification expert. In 1997, my colleagues and I launched the Árokszállás Biology and Environmental Protection Competition, of which I am the main organiser. My school has had a great natural sciences tradition. My work in preparing my students for the advanced Matura examination and in my capacity as a form teacher is a top priority for me. I prepare my students continuously, hold special after-school lessons, and organise fieldwork and lectures. I have received a number of certificates at national competitions through my students as well as a certificate of appreciation from the city. My greatest source of pride is my students' success and the happy smiles on their faces when they achieve their goals.

UNIVERSITY PROGRAM

RESEARCH CENTERS

UNIVERSITY OF SZEGED

The University of Szeged is one of the leading universities of Hungary, committed to maintaining quality higher education.

The University was established by the integration of Attila József University, Albert Szent-Györgyi Medical University, Szeged College of Food Industry, Gyula Juhász Teacher Training College and the College of Agriculture in Hódmezővásárhely. The University of Szeged offers a wide range of educational opportunities for the students: hundreds of basic, master, doctoral and higher educational professional training programs, just like adult training and postgraduate specialist training courses. With its nearly 25,000 students and 7,000 employees (out of which 2,400 are academic researchers and teachers), the University of Szeged is one of the largest institutions of the Southern Great Plain region. Teaching and research are performed by the 12 Faculties while medical health care is the task of the Albert Szent-Györgyi Health Center. The mission and aim of the University is to cultivate science and internationally competitive research work and to advance its research university nature.

BIOLOGICAL RESEARCH CENTER

The Biological Research Center (BRC) is an outstanding institution of the internationally acknowledged Hungarian biological research. It was founded in 1973. The 4 institutes of BRC - the Institutes of Biophysics, Biochemistry, Genetics and Plant Biology - employ about 260 scientists whose work is hall-marked by highly appreciated international scientific publications and patents. The research topics include several fields of molecular and cell biology from the industrial utilization of bacteria through controlled improvement of cultivated plants to the problems of human health and environmental protection. BRC is mainly a scientific basic research center, but scientists of BRC play an initiative role in the foundation and promotion of biotechnological companies, as well as in educational duties. The successful activity and high-level scientific research pursued in BRC were also acknowledged by the European Molecular Biological Organization (EMBO) and in 2000 the European Union awarded the title of "Center of Excellence" to BRC.

(http://www.brc.hu/about_brc.php)

SZENT-GYÖRGYI MENTORS

"If I go out into nature, into the unknown, to the fringes of knowledge, everything seems mixed up and contradictory, illogical, and incoherent. This is what research does; it smooths out contradictions and makes things simple, logical, and coherent."

Albert Szent-Györgyi

Szent-Györgyi Mentors of the Szeged Scientists Academy are researchers, who engage in internationally highly reputable scientific activities, supervise their own research groups, and whose works are published in prestigious scientific journals.

Szent-Györgyi Mentors are committed to participate in the education of the *Szent-Györgyi Students*, offering them the opportunity to join their research groups that provide the required conditions for research. *Szent-Györgyi Mentors* also personally assist in training and developing the young talents, primarily focusing on the importance of nurturing talent.

Szent-Györgyi Mentors also undertake to involve other mentors from among his or her foreign partners in the activities of the Szeged Scientists Academy as *Szent-Györgyi International Mentors* so as to provide *Szent-Györgyi Students* with the ability to participate in the projects of foreign laboratories as well.

Currently, there are 42 *Szent-Györgyi Mentors* supporting the *Szent-Györgyi Students* of the Szeged Scientists Academy. They are renowned and recognised scientists of the University of Szeged and the Biological Research Center, and they are all part of a widespread international network of scientists and researchers. They engage in internationally admired microbiological, genetic and biomedical research.

ZOLTÁN RAKONCZAY

PROFESSIONAL LEADER OF
THE UNIVERSITY PROGRAM

Department of Pathophysiology
University of Szeged

Address: Semmelweis u. 1., H-6725 Szeged, Hungary

RESEARCH AREA

Acute pancreatitis is a sudden inflammation of the pancreas which can have mild or severe course. Unfortunately, the latter form still has an unacceptably high mortality. The reason for this is, at least in part, due to the facts that the pathomechanism of acute pancreatitis is unclear and we have no specific treatment of the disease. The main aims of our group are to investigate the roles of various inflammatory factors, mitochondria and the recently identified pancreatic ductal cells in the development of acute pancreatitis. Our hope is to eventually open up new therapeutic possibilities in acute pancreatitis.

TECHNIQUES AVAILABLE IN THE LAB

Induction of acute pancreatitis in animals, isolation of pancreatic acinar and ductal cells, measurement of enzyme (amylase, trypsin, myeloperoxidase, lactate dehydrogenase) activities, confocal microscopy, histological analysis, ELISA, microspectrofluorimetry (intracellular H^+ , Ca^{2+} concentration), microperfusion of pancreatic ducts, measurement of pancreatic ductal fluid secretion, Western blot analysis, RT-PCR.

ISTVÁN ANDÓ

Laboratory of Immunology
Institute of Genetics
Biological Research Center

Address: Temesvári krt. 62., H-6726 Szeged, Hungary

RESEARCH AREA

The development of blood cells and the immune response are regulated by a complex gene regulatory network that connects their transcriptional and epigenetic machinery the microenvironment. This enables the cells to respond immediately to any stress, including the attacks of microorganisms and parasites. The characterization of these regulatory networks is essential for the understanding of immunity and the implementation of specific immunotherapy.

The research interests in my laboratory focus on the basic phenomena of immunity using the model organism *Drosophila melanogaster*, with a prototype of immunity. We pursue this project with the aim to understand blood cell development and the innate immune response.

TECHNIQUES AVAILABLE IN THE LAB

Combination of methods in basic biology, immunology, cell biology, and molecular genetics.

FERENC BARI

Department of Medical Physics and Informatics
Faculty of Medicine
University of Szeged

Address: Korányi fasor 9., H-6720 Szeged, Hungary

RESEARCH AREA

Adequate and continuous blood supply of the brain requires a very precise regulatory mechanism. Investigating the properties of the cerebral microcirculation opens a unique way for understanding the details (components, dynamics) of blood flow regulation in both the healthy and the injured brain. We have been studying the major characteristics of the neurovascular coupling (enhanced neuronal activity is followed by changes in the local blood perfusion) for more than 20 years. We have obtained considerable knowledge on the nature of excitatory amino acid release and the concomitant changes in local microcirculation. We have intensively studied the vascular consequences of hypoxic-ischemic injuries and tested various, potentially neuroprotective strategies. We study cerebral microcirculation in various animal models. Our major approach is using optical methods (intravital microscopy, laser Doppler flowmetry, laser speckle contrast analysis [LASCA]). In addition, we perform *ex vivo* studies in order to characterize morphological alterations and changes in protein expression in the injured brain. Recently, we have been working on new neuroprotective approaches.

During the last years our research interest involves the question how medical informatics could help in stroke prevention and treatment of stroke victims.

TECHNIQUES AVAILABLE IN THE LAB

Intravital microscopy, laser Doppler flowmetry, laser speckle contrast image analysis, brain electrophysiology, monitoring of vital functions of anesthetized animals, data evaluation and analysis.

ZSUZSANNA BATA-CSÖRGŐ

Department of Dermatology and Allergology
University of Szeged

Address: Korányi fasor 6., H-6720 Szeged, Hungary

RESEARCH AREA

Psoriasis is the most common inflammatory skin disease among Caucasians. Our research focus is on the pathomechanism of this disease. The disease is polygenic with complex pathology therefore our work has different aspects: immunology, epidermal and dermal biology, regulation of cell proliferation and differentiation and extracellular matrix biology. We are engaged in classical theory driven research, but also use large scale studies. The research group is closely related to the clinic that makes it possible to use human tissues and cells for some of our work, which enhances the clinical relevance of our results. Some of our work is more basic research, we investigate normal and pathological functions of keratinocytes, fibroblasts and melanocytes.

TECHNIQUES AVAILABLE IN THE LAB

Separation and culture of various cells, immunostaining techniques on tissues and on cells, flow cytometry methods, cell cycle analysis, Western blot, RT-PCR, proteomic techniques.

ANTAL BERÉNYI

MTA-SZTE 'Lendület'
Oscillatory Neuronal Networks Research Group
Department of Physiology, Faculty of Medicine
University of Szeged

Address: Dóm tér 10., H-6720 Szeged, Hungary

RESEARCH AREA

Recent technical development gave a new momentum to experiments studying the brain, although the extremely complex structure of the nervous system still supplies the researchers with an endless inventory of open questions.

In our research we investigate the possible therapeutic effects of Transcranial Electrical Stimulation (TES) on epileptic seizures. Particularly, we plan to develop a focused stimulation protocol both in time and space to interact only with the desired brain areas within an appropriate time-frame. To determine the appropriate focal points of stimulation, we investigate the internal dynamics of neural networks involved in seizure generation. We do this by performing a throughout analysis of networks on microscopic and mesoscopic scale with extremely high spatial and temporal resolution. The same approach is used to focus on the role of hippocampus and related circuitries in memory formation and spatial navigation. We pay special interest to the role of sensory information in this field.

Our long-term vision is to develop a closed-loop, implantable seizure suppressor device that continuously monitors the patterns of brain activity, and delivers electrical pulses in order to terminate any occurring seizures. We are hoping to translate our laboratory-stage experimental results into clinical trials within a few years.

TECHNIQUES AVAILABLE IN THE LAB

Extra- and juxtacellular recording techniques, transcranial electrical stimulation, freely moving animal models to study the correlation of behavior and neuronal activity patterns, basic histology and immunohistochemistry, double transgenic animal models for optogenetical research, analog and digital electronics development, microcontroller programming, signal processing algorithms, advanced data mining techniques, Matlab and Labview programming languages, non-supervised pattern recognition algorithms.

ZSOLT ENDRE BOLDOGKŐI

University of Szeged, Faculty of Medicine
Department of Medical Biology

Address: Somogyi B. u. 4., H-6720 Szeged, Hungary

RESEARCH AREA

The main projects of our research group:

1. Genetic regulation in various viral families: We have been assembling the transcriptome atlases of various viruses using short- and long-read sequencing technologies. We have currently been investigating the following viruses: herpes simplex virus, pseudorabies virus, varicella-zoster virus, human cytomegalovirus, Epstein-Barr virus, vaccinia virus, influenza virus, a baculovirus, an endogenous retrovirus, a circovirus, various RNA viruses, etc.

Additionally, we have been examining how the transcriptions as well as the transcription and the DNA replication are interrelated with each other. We have put forward two hypotheses for assuming a genome-wide interplay among the transcription and replication machineries, which are the Transcription Interference Network (TIN) hypothesis and the Transcription and replication Network (TRIN) hypothesis, respectively.

2. Generation of intelligent viral vectors for brain research: Application of genetically modified pseudorabies virus for transneuronal tract-tracing, as well as analysis of neural activity using optical methods.

3. Examination of the genetic basis of major depression and suicide: high-coverage whole-exome analysis of depression.

TECHNIQUES AVAILABLE IN THE LAB

1. Long-read and short-read sequencing: Illumina next generation sequencing; Oxford Nanopore Technologies and Pacific Bioscience third-generation sequencing platforms. We have tested various methods using these platforms, including Cap-selection, direct RNA sequencing, targeted sequencing, etc.

2. Molecular cloning: application of restriction endonucleases and CRISPR-Cas9 technology, recombinant virus technology, etc.

3. PCR and real-time RT PCR: These techniques are used for quantitative analysis of gene expression.

4. Microscopy: light microscopy, as well as, confocal and fluorescence microscopy.

IMRE MIKLÓS BOROS

Institute of Biochemistry
Biological Research Center

Department of Biochemistry and Molecular Biology
University of Szeged

Address: Közép fasor 52., H-6726 Szeged, Hungary

RESEARCH AREA

Transcription of eukaryotic genes is a multistep process that involves a large number of functionally different proteins and requires the ordered assembly of giant multiprotein complexes. In recent years the important role of chromatin structure in transcription regulation has been recognized and new directions in transcription research have been initiated. It is hoped that a better understanding of the roles of functionally distinct classes of transcription regulatory proteins and chromatin modifiers will provide keys to decipher why and how can these drive development and can be de-regulated in diseases like cancer.

In joint laboratories located at the BRC and at the Biochemistry and Molecular Biology Department of SzU we use combined approaches to characterize proteins which modify chromatin structure. In one area of research we focus our studies on histone proteins used only under specific conditions for example at the very early stage of embryonic development. For these studies we use *Drosophila* model, as this permits us to combine genetic and cell- and molecular biology methods. Another research approaches we study gene expression changes in cancer cells. For this we use clinical samples and are primarily interested in identifying the genetic alterations that contribute tumor formation.

TECHNIQUES AVAILABLE IN THE LAB

The techniques we use regularly to study different aspects of gene expression consist of a very broad range of genetic, biochemical, cell biology and molecular biology methods. That means daily use of techniques of genetic engineering including the classic ways of DNA manipulations and cloning and also the latest methods of targeted genome editing, chromatin immunoprecipitation and next generation sequencing. In addition to DNA we work extensively with proteins and use diverse methods for purify proteins from different sources and analyze protein-protein interactions.

RESEARCH AREA

Surgical research can bring together many clinical disciplines and interests, ranging from cardiovascular biology to gastroenterology. The ischemia-reperfusion (I/R)-induced cellular hypoxia - reoxygenation, and subcellular oxidoreductive stress are major determinants of mortality and morbidity in many areas of clinical practice, such as sepsis or shock situations, and investigations targeting the I/R-caused microcirculatory dysfunction are essential for development of treatment strategies for several clinical pathologies. From a general perspective, it is worth pointing out that any intervention protecting microcirculation is likely to result in protection of tissue function and structure. In this scheme we have characterized the anti-inflammatory potential of membrane-forming phospholipids in I/R-induced antigen-independent inflammation, and the observation that methane formation from phosphatidylcholine metabolites occurs in ischemic systems opened up new avenues for future research. Currently we examine the possible biological roles of endogenous methane formation and whether methane - or potentially methane-releasing agents influence I/R-induced microcirculatory dysfunctions and modulate the outcome of inflammation.

TECHNIQUES AVAILABLE IN THE LAB

Fundamental surgical techniques with complete hemodynamic monitoring and distinct imaging possibilities, such as intravital fluorescence microscopy and orthogonal polarization spectral imaging for *in vivo* microcirculatory analysis. Confocal laser scanning endomicroscopy for *in vivo* gastrointestinal histology. Detection of whole body methane emission by photoacoustic spectroscopy. High-resolution respirometry for mitochondrial studies.

TAMÁS CSONT

Department of Biochemistry
Faculty of Medicine
University of Szeged

Address: Dóm tér 9., H-6720 Szeged, Hungary

RESEARCH AREA

Cardiovascular diseases and especially acute myocardial infarction are among the leading causes of death worldwide. Although prevention and the therapy of myocardial infarction have been significantly improved in the last decades, mortality is still unacceptably high. Therefore, development of new therapies aiming to attenuate infarct size is very relevant. Thus, our research group investigates the molecular mechanisms of infarction as well as the adaptive responses of the myocardium to ischemic stress (pre- and postconditioning) to develop novel potential therapies for the treatment of myocardial infarction. Since the risk of myocardial infarction is increased by the presence of several co-morbidities and risk factors including high cholesterol level, diabetes, obesity, hypertension, smoking, lack of exercise, kidney failure, etc., we also look at the effects of certain risk factors on the myocardium as well as on adaptive mechanisms of the heart.

TECHNIQUES AVAILABLE IN THE LAB

Induction and treatment of disease models (e.g. diabetes, hypercholesterolemia) in experimental animals, echocardiographic assessment of cardiac morphology and function, surgical interventions to induce disease models (myocardial infarction, heart failure, kidney failure, etc.), isolated heart perfusion, determination of infarct size, induction and maintenance of cell culture, viability assays, transfection, general biochemical methods to determine metabolites, proteins and nucleic acids (spectroscopy, western blot, ELISA, flow cytometry, histochemistry, PCR, etc.).

MÁRIA DELI

Biological Barriers Research Group
Institute of Biophysics
Biological Research Center

Address: Temesvári krt. 62., H-6726 Szeged, Hungary

RESEARCH AREA

Organisms are protected by biological barriers from harmful effects. These barriers also impede drug penetration. Our lab investigates methods to increase drug delivery on culture models of the blood-brain, nasal, corneal, respiratory and intestinal barriers. The pathways examined are (i) reversible opening of tight intercellular junctions by peptides or small molecules; (ii) targeting solute carriers at barriers for drug delivery by nanoparticles. Cellular toxicity of active ingredients and pharmaceutical excipients are measured by a real-time impedance-based method. Double and triple co-culture models are used for experiments, and a microfluidic integrated chip has been developed in a collaborative project. Our other major research interest is the examination of blood-brain barrier injury and dysfunctions in different diseases, like Alzheimer's disease, acute pancreatitis and diabetes. The goal of these experiments is to reveal the effect of disease pathogenic factors on blood-brain barrier functions and to identify protective molecules. The protection of brain endothelial cells and the improvement of BBB functions in pathological conditions, the exploration of new approaches for drug transport/targeting to brain may have therapeutic potential in the treatment of central nervous system diseases.

TECHNIQUES AVAILABLE IN THE LAB

Mammalian cell culture; primary cultures from brain and brain microvessels; models of biological barriers by double and triple co-cultures; cell culture models in microfluidic chips; electric resistance measurements of cell layers; permeability of drugs across culture models; immunohistochemistry; phase contrast, fluorescent and confocal microscopy; ELISA; measurement of nitric oxide and reactive oxygen species production in cells; colorimetric and impedance-based toxicity tests.

ANDRÁS DÉR

Work Group of Bioelectronics
Institute of Biophysics
Biological research Center

Address: Temesvári krt. 62., H-6726 Szeged, Hungary

RESEARCH AREA

Bioelectronics has a double meaning in scientific literature. On the one hand, as a branch of basic biophysical sciences, it deals with electric phenomena appearing on any organization level of living systems. On the other hand, as a recently developed discipline of information technological science, it explores the potential of biological materials for application in molecular electronics. These two areas of research are in close interaction not only with each other, but also with other disciplines of basic applied sciences.

Our main goal is to develop novel methods on integrated micro- and nanotechnological platforms for the investigation of light-induced processes in biological membranes, and utilize them in both branches of bioelectronic science. The most important scientific problems to be solved are, on the one hand, concerned with the investigation of electric properties of single cells and cellular interfaces, while on the other hand with the application of photochromic proteins in optoelectronics and photonics. Besides its impact on basic biophysical science, our research is expected to have utilizations in various branches of applied bioelectronics.

TECHNIQUES AVAILABLE IN THE LAB

Photoelectric measuring techniques, absorption kinetics, polarisation methods, electro-optics, photolithography, laser-assisted microstructure building, surface coating techniques, TIRF-microscopy, MATLAB programing, LabVIEW programing.

Department of Biochemistry
Faculty of Medicine
University of Szeged

Address: Dóm tér 9., H-6720 Szeged, Hungary

RESEARCH AREA

The Biochemistry Department follows the traditions of the school of Albert Szent-Györgyi in muscle research. Former achievements in the area, as the discovery of actin, the characterization of actin-myosin-ATP involvement in muscle contraction, crystallization of the calcium pump enzyme in muscle paved the way until now. Recent research interest is focused on the development, differentiation and regeneration of muscle tissues at the molecular level. Neural and humoral factors, as well as extracellular matrix components involved in these processes are under study. Another main field of research and development activities is the standardization, quality assurance of diagnostic methods in clinical biochemistry and molecular biology. The development and application of reference materials for the area.

TECHNIQUES AVAILABLE IN THE LAB

Qualitative and quantitative protein and nucleic acid analytical methods, cell and tissue culture, histochemistry and immunohistochemistry, morphometry, flow cytometry, characterization of molecular regulatory systems.

ESZTER FARKAS

Department of Medical Physics and Informatics
Faculty of Medicine
University of Szeged

Address: Korányi fasor 9., H-6720 Szeged, Hungary

RESEARCH AREA

Constant, undisturbed blood supply is critical for the optimal function of the brain, the organ that regulates our body. The brain accounts for only 2% of the entire body weight, yet it receives 15% of the cardiac output and consumes 20% of available oxygen. Accordingly, any disruption or limitation of cerebral blood supply has major consequences on the integrity of the nervous tissue. Our research activities focus on various aspects of the pathophysiology of cerebrovascular diseases in experimental models.

Ischemic injury to the brain favors the occurrence of spreading depolarization. Spreading depolarization is a self-propagating, transient disruption of cellular ionic homeostasis in the cerebral gray matter, which is potentially harmful to the nervous tissue. We have developed a sophisticated, live, multi-modal imaging technology, which enables us to study the evolution of spreading depolarization under experimental conditions. Our current goal is to determine how the typical features of ischemia-induced spreading depolarization are altered in old age. This is a highly relevant question, taken that cerebrovascular diseases predominantly occur in the aging population.

TECHNIQUES AVAILABLE IN THE LAB

Application of the Biopac© system for data acquisition and analysis, basic experimental surgical techniques, electrophysiology (DC potential and EEG recording, measurement of pH and extracellular potassium concentration in the nervous tissue), experimental microsurgery, image analysis, *in vitro* brain slice preparation, intrinsic optical signal analysis, laser Doppler flowmetry, laser-speckle contrast imaging of local cerebral blood flow, pharmacology, statistical methods, voltage-sensitive and pH-sensitive dye imaging of cellular trans-membrane potential.

ATTILA GÁCSE

Department of Microbiology
University of Szeged

Address: Közép fasor 52., H-6726 Szeged, Hungary

RESEARCH AREA

Infectious diseases are one the leading causes of mortality worldwide, killing millions of people every year. While bacteria and viruses cause the majority of deadly infections, notably the number of fungal diseases is increasing at an alarming rate. In fact, it is estimated that nearly as many people die annually from invasive fungal infections as from the greatly feared tuberculosis (1.4 million) or malaria (1.2 million). Our research program focuses on the most common human fungal pathogens, the opportunistic *Candida* species with special focus on *C. parapsilosis*. We investigate the basic mechanisms of fungal pathogenesis and host immunity, and we aim to improve diagnosis and identify novel biomarkers of infection. Recently, we also investigate the role of the human "mycobiome" in health and disease development and progression.

TECHNIQUES AVAILABLE IN THE LAB

In vitro infection models using phagocytes (murine and human cell lines, primer immune cells). Measurement of fungal cell phagocytosis with Flow Cytometry or microscopy, cytokines-chemokines with ELISA, host damage with LDH-assay. Quantitative imaging using FlowSight. *In vivo* infection models using wild type and transgenic mice. Colony formig unit measurements from different organs, histological analysis, immune cell preparation from infected animals. Basic and advanced molecular techniques, qRT-PCR, Western blot, Southern blot, CRISPR/Cas9 technology, GATEWAY-cloning system.

LAJOS HARACSKA

Mutagenesis and Carcinogenesis Laboratory
Institute of Genetics
Biological Research Center

Address: Temesvári krt. 62., H-6726 Szeged, Hungary

RESEARCH AREA

Stalling of the DNA replication machinery, which occurs as a consequence of encountering unrepaired DNA damage, is a challenge for cells. To rescue the stalled replication fork, different DNA damage bypass mechanisms have evolved that promote replication through DNA lesions. In humans, increased error-prone bypass of DNA lesions causes increased mutagenesis and, as a consequence, a rise in the incidence of cancers. Error-free bypass processes, by contrast, keep mutagenesis low and reduce the frequency of cancers. Our research laboratory is interested in the driving forces and molecular mechanisms of mutagenesis and carcinogenesis. In particular, we investigate the following questions: What are the common roots of evolution and carcinogenesis? What are the molecular mechanisms of chromosomal rearrangements and the formation of point mutations? Why do we observe increased genome instability during carcinogenesis? What is the role of the recently described DNA repair genes in cancer suppression? Why do mutations in certain genes predispose to cancer? Which genes are commonly mutated in cancer, and how do these mutations contribute to tumour development and drug resistance? We investigate these challenging problems using human tissue culture-based reporter systems, next-generation DNA sequencing and purified proteins in reconstituted reaction pathways. Our research provides more insight into the molecular events of genome instability, carcinogenesis and has the potential to identify new tumour markers and drug targets as well as to improve personal cancer treatment.

TECHNIQUES AVAILABLE IN THE LAB

Next-generation DNA sequencing, PCR, qPCR, protein microarray, human tissue culture-based reporter assays such as cell survival, mutagenesis, homologous recombination and various tests, confocal microscopy-based techniques such as protein localization, DNA replication and chromosomal rearrangements, protein overexpression and purification, immunological assays, biochemical enzyme assays, and yeast genetic methods.

PETRA HARTMANN

University of Szeged
Institute of Surgical Research

Address: Pulz utca 1., H-6724 Szeged, Hungary

RESEARCH AREA

Previous studies constructed a comprehensive picture on the biological effects of exogenous methane (CH_4) in various ischemia-reperfusion (IR) and inflammatory settings. However, the underlying mechanisms are still not known with certainty; and the immediate challenge is therefore to test hypotheses to understand the background of CH_4 -induced reactions. Our main purpose is to examine the effects of CH_4 on possible cellular and subcellular targets, including mitochondria and to apply CH_4 in complex, *in vivo* animal models of IR, focusing on specific organ functions.

TECHNIQUES AVAILABLE IN THE LAB

In vivo animal models (rodents and large animals), *in vivo* imaging techniques with fluorescent laser-scanning endomicroscopy or intravital microscopy. Microcirculatory measurements with orthogonal polarization spectral imaging and laser-Doppler. *Ex vivo* organ perfusion systems (liver, kidney) for static and dynamic graft preservation. Measurement of mitochondrial respiration, hydrogen-peroxyde production and membrane potential using high-resolution respirometry and its fluorescent moduls (Oxygraph2k). Basic laboratory techniques (spectrophotometry, isolation of mitochondria).

PÉTER HEGYI

First Department of Medicine
University of Szeged

Address: Korányi fasor 8-10., H-6720 Szeged, Hungary

RESEARCH AREA

Epithelial cells form a sheet-like contiguous layer that covers both the external and internal free surfaces of the body, e.g. the surface of skin or inner surface of hollow organs such as in the gastrointestinal tract (GIT). The epithelial cells in the GIT secrete over 10 liters of digestive fluid daily into the lumen - and after digestion - absorb the fluid and nutrients from the lumen. Derangement of this secretory process can lead to severe disorders such as cystic fibrosis or secretory diarrhoea. One of our main research interests is to understand the physiology and pathophysiology of secretory mechanisms.

Most recently we have shown that epithelial fluid and ion secretion plays a crucial role in acute pancreatitis which is one of the most severe inflammatory diseases of the GI tract. Therefore, repairing the damaged secretion may lead to a new specific therapeutic way in acute pancreatitis. Besides our interest in the pancreas we work on understanding the oesophageal, gastric and colonic fluid and ion transport mechanisms.

TECHNIQUES AVAILABLE IN THE LAB

Isolation of epithelial cells from human and animal, culturing of cells, measurement of fluid secretion using video-technique, measurement of intracellular ion (H^+ , Ca^{2+}) concentrations using fluorescence imaging microscopy, western blotting, working with DNA and RNA, measurement of mitochondrial damage using confocal microscopy, *in vivo* experimental animal models.

RESEARCH AREA

Natural products play an important role in drug discovery because of their unmatched structural diversity, amazing, and often complex structures. The aim of our group is to perform purposeful research by rational selection of plant extracts and compounds to be isolated, in order to obtain efficiently new secondary plant metabolites, which are perspective for drug discovery. Literature data, ethnomedicinal knowledge, results of screen investigations and metabolomic approaches are considered for selection of plant species. Compounds are isolated from the very complex multi-component extracts exhibiting efficacy in the used tests, with the aid of different chromatographic methods by guidance of bioassay. The structures of the purified compounds are determined by means of spectroscopic methods (NMR and MS). The biological activity is usually investigated in collaborations.

TECHNIQUES AVAILABLE IN THE LAB

Solid-solid and solid-liquid extraction techniques, evaporators; chromatographic techniques (OCC, GC, VLC, CPC, Flash, SE, SFC, MPLC, HPLC) coupled with UV-Vis, PDA, light scattering and MS detectors; ESIMS, HRMS, 1D and 2D NMR for structure elucidation; microplate reader, bioassays for antimicrobial, antitumor, ion channel activity in collaboration.

RESEARCH AREA

Recent advances in light microscopy have changed the way biological research is conducted. The ability to acquire massive amounts of image data has given rise to new fields such as high content screening (HCS) or 3D imaging, which promise to open new doors both for basic research and drug discovery. However, with such massive amounts of data comes a need for automatic analysis tools. Our research concentrates on how human knowledge can be best integrated into intelligent computer algorithms for automated microscopy. To reach this goal, we have interest in image processing that is concerned with extracting biologically relevant quantitative information in 3-4-5D imaging and multi-parametric machine learning analysis that is necessary to make sense of this information. Recently, machine learning algorithms have become a popular solution for analyzing large single cell-based imaging scenarios. We concentrate on improving the state-of-the-art by detecting unusual patterns corresponding to unknown phenotypes.

TECHNIQUES AVAILABLE IN THE LAB

Various microscopy and computational techniques are available in the BIOMAG laboratory. These include high-content screening, confocal, laser microdissection, light-sheet, point scanning confocal microscopy; and various image analysis and machine learning approaches and software and hardware infrastructure.

RESEARCH AREA

Cancer is a leading cause of morbidity and mortality worldwide, and it is expected that annual cancer cases will rise from 14 million in 2012 to around 22 million within the next two decades. Resistance is a major factor promoting failure of chemotherapy and there is an urgent need for new therapeutic strategies.

By following a natural product inspired drug discovery strategy, our group focuses on novel chemical approaches to fight cancer and particularly multi-drug resistant cancer. In this endeavor, we aim at the preparation of nature-inspired chemical scaffolds that can act as chemo-sensitizers on resistant tumor cells, hence can be used as non-toxic adjuvants in combination with chemotherapeutics. A broad scale of interesting natural products is utilized as starting materials, e.g. well-known antioxidants, insect hormones utilized as anabolic food supplements, etc. Thanks to this and to our intensive international collaboration, an inspiring multidisciplinary working environment awaits the candidates to join our team.

TECHNIQUES AVAILABLE IN THE LAB

Extraction and preparation of herbal constituents, as well as simple chemical reactions for their structural modification, a wide array of separation techniques used in natural product chemistry, including analytical and preparative HPLC, supercritical fluid HPLC (SFC), centrifugal partition chromatography (CPC), rotational planar chromatography, TLC and column chromatography, structure elucidation by spectroscopic techniques (NMR, MS, UV-VIS).

GÁBOR JUHÁSZ

Institute of Genetics
Biological Research Center

Address: Temesvári krt 62., H-6726 Szeged, Hungary

RESEARCH AREA

Autophagy is a fundamental catabolic pathway in eukaryotic cells. During the main route, portions of cytosol and organelles are captured into double-membrane autophagosomes, which then fuse with lysosomes to deliver their cargo for degradation and reuse. Our group is studying the role and mechanisms of autophagy mainly using the popular animal model *Drosophila*. We are also working on related trafficking pathways including endocytosis and crinophagy (secretory granule degradation). In recent years, we have started experiments to understand the regulation of lysosomal function.

TECHNIQUES AVAILABLE IN THE LAB

Genetic manipulation of *Drosophila* and cultured human cells: gene knockouts, transgenic reporter constructs, mosaic analysis. Confocal microscopy, autophagic degradation and endocytic uptake and degradation assays. Transmission electron microscopy. Western blots, immunoprecipitations, proteomic analysis (done by the core facility). Cell culture facilities, yeast twohybrid, molecular cloning, RT-PCR and qPCR. Purification of recombinant proteins, biochemical binding and structural assays, antibody production.

University of Szeged

Address: Pulz u. 1., H-6724 Szeged, Hungary

RESEARCH AREA

Sepsis remains one of the leading causes of death in the intensive care units which necessitates the development of new diagnostic tools and novel, more efficient therapeutic possibilities. The basic problem in sepsis is the discrepancy between oxygen delivery and oxygen consumption which can lead to irreversible oxygen extraction deficit and energy shortage. The cornerstone of acute care should be to prevent, assess and treat oxygen debt globally. We propose that causative factors and signs of oxygen deficit have to be examined together on microcirculatory, cellular (endothelial) and subcellular (mitochondrial) levels in different shock-affected organs (e.g. the intestine and lung) by employing sufficiently long-term, clinically relevant experimental models. With this theoretical background, the major goal of our study is to find optimal, clinically applicable manoeuvres for microcirculatory recruitment and mitochondrial resuscitation to minimize the energy deficit of organs during the septic response.

TECHNIQUES AVAILABLE IN THE LAB

Our research laboratories are equipped with instruments to identify macro- and microcirculatory changes (hemodynamic computerized data-acquisition and analysis systems, laser-Doppler flowmetry, fluorescence-based intravital microscopy, orthogonal polarisation spectral imaging). Fluorescence confocal laser scanning endomicroscopy technique offers the possibility of acquiring precise *in vivo* data for histological analysis. A high resolution respirometer is available for examination of mitochondrial function (activities of the components of electron transport chain) and additional laboratory facilities (ELISA) to study inflammatory biomarkers. Animal house and fully-equipped operating theatres are available for surgical intervention of small (rats) and larger animals (minipigs).

LAJOS KEMÉNY

Department of Dermatology and Allergology
University of Szeged

Address: Korányi fasor 6., H-6720 Szeged, Hungary

RESEARCH AREA

Trillions of bacteria, fungi and viruses colonize the skin surface, collectively comprising the skin microbiome. There is a continuous interaction in between the microbes and the different cells in the skin. Recent data suggest, that the skin commensal bacteria play an important role in providing a protection against more harmful bacteria, and in the regulation of skin immune system. Commensal bacteria can activate the different cells in the skin to produce inflammatory mediators. However, it is not known, how the skin cells can differentiate in between commensal and pathogenic bacteria? How do we tolerate the great number of bacteria without inducing inflammation in the skin? In special circumstances, the commensal flora has been suggested to play a role in the induction or in the maintenance of chronic inflammatory skin diseases, such as acne, rosacea or psoriasis. Important member of the skin's commensal flora is the bacterium called *Propionibacterium acnes* (*P. acnes*). Even though it resides in the pilosebaceous unit of the skin, under certain circumstances it may also play an important role in the pathogenesis of acne, the most common inflammatory skin disease. We investigate how and when this commensal microbe turns pathogenic and how this bacterium influences the skin immune system.

TECHNIQUES AVAILABLE IN THE LAB

Various cell separation techniques, cell culturing methods, flow cytometry, immune-staining techniques of tissues and cells, protein, mRNA detection, cell cycle analysis, cell proliferation measurements.

ZSIGMOND TAMÁS KINCSES

Department of Radiology
University of Szeged

Address: Semmelweis u. 6, H-6724 Szeged, Hungary

RESEARCH AREA

One of the best method to acquire data about brain structure and function is magnetic resonance imaging (MRI). The structure can be measured at different levels: the volume of the brain, gray and white matter and the subcortical structures can be estimated from structural scans, and microscopic information about the tissue integration can be gathered from diffusion weighted MRI images.

Brain regions activating during certain tasks can be identified with MR sequences sensitive for the blood oxygen content. And the very same functional MRI acquisition can be utilised to detect the resting activity fluctuations in the brain. The synchronous activity fluctuations of remote brain regions identifies functional networks. The time-dependent changes of these connections mark out brain states.

In our research group we investigate the alterations of brain structure and function in various neurological disorders.

Headache disorders: Our studies pointed out that the pathomechanism in migraineurs experiencing aura symptoms before the headache is very different from those patients who has no aura symptom. The microstructure of the white matter shows marked differences in the two subtype of the disease that is correlated with the resting activity fluctuation of the white matter.

Multiple sclerosis: We showed that the disintegration of the periventricular white matter has a close relationship with the cortical atrophy. Our results called attention to the fact that various forms of clinical disability and cognitive disfunction is defined by different set of MRI measured parameters.

Stroke: Our investigations showed that the resting activity fluctuation of the hypoperfused brain is delayed as compared to the homologous contralateral normal side. Furthermore we showed that the functional hyperaemia is delayed in stroke patients. Our newest results indicated that the functional connectivity of the contralesional motor cortex is altered that is a function of functional recovery.

TECHNIQUES AVAILABLE IN THE LAB

Theory of the MRI measurements. Human neurophysiological techniques: EEG, evoked potentials, transcranial magnetic and direct current stimulations.

Structural MRI investigations: Brain volumetry, processing of diffusion tensor images, tractography.

Functional MRI investigations: Detection of task-related brain activation patterns, evaluation of resting state fMRI data, independent component analysis, dynamic functional connectivity

Basic programming skills: Matlab, Python, bash

Statistical approaches: conventional model based approaches, permutation, bootstrapping

Neurological examination of patients. Neuroradiological evaluation of MRI images.

BÁLINT KINTSES

Synthetic and Systems Biology Unit
Institute of Biochemistry
Biological Research Center

Address: Temesvári krt. 62., H-6726 Szeged, Hungary

RESEARCH AREA

The human body is a complex ecosystem consisting of the host and its associated microbiota made up of hundreds of beneficial commensal and disease causing pathogenic and opportunistic pathogenic bacterial species. As modern human lifestyles keep changing the ecological environment of the human microbiota at an unprecedented pace, these bacteria respond to these changes with continuous adaptation. A well known consequence of this process is the global antibiotic resistance crisis which is responsible for over 700,000 deaths annually, primarily driven by the emergence of multi-drug resistant opportunistic pathogenic bacteria. In our laboratory, we develop novel technologies in the field of synthetic biology, genomics and genome engineering for two complementary goals. First, to understand the evolutionary dynamics of antibiotic resistance development, and second, to develop novel therapeutic approaches designed to selectively target multi-drug resistant pathogenic bacteria. Beyond asking fundamental scientific questions, we are interested in the utilisation and commercialisation of our inventions.

TECHNIQUES AVAILABLE IN THE LAB

Functional genomics and functional metagenomics, bacterial genome engineering, phage biology and phage engineering, directed evolution, molecular biology and DNA cloning techniques, classic and state-of-the-art microbiology techniques, working with biology safety level 2 pathogenic bacteria, 16S rRNA sequencing of the gut microbiome, next-generation sequencing techniques, data analysis and bioinformatics in R.

RESEARCH AREA

The general strategy to treat cancer relies largely on traditional chemotherapy using small molecular drugs. Although conventional chemotherapy has a decent success rate it frequently causes severe side effects and can even result in the evolution of multidrug resistant cancer phenotypes. Nanoparticle based treatment of solid tumors is regarded as a novel, attractive strategy to improve cancer therapy, since approximately 10-200 nm sized materials are selectively accumulated in tumor tissues due to the passive targeting effect, where many of them, especially metallic particles can exert direct anti-cancer activity. Owing to their large surface area nanomaterials can also serve as controllable delivery platforms of various cytotoxic drugs for active tumor targeting. Our research group investigates the cellular and molecular events behind the anti-cancer activity of different types of metal nanoparticles in *in vitro* and *in vivo* animal model systems.

TECHNIQUES AVAILABLE IN THE LAB

Standard cell and tissue culture techniques, *in vitro* model systems, co-cultures, testing drugs and nanomaterials, toxicity screens, cell migration and invasion assays, biochemical and molecular biology methods, ELISA, Western blot analysis, RT-qPCR, next generation sequencing, fluorescent and confocal microscopy, histological analysis, immunocytochemistry, reporter systems, gene silencing.

RESEARCH AREA

The central nervous system is one of the most complex and meantime the most sensitive part of our organism. For its proper function the central nervous system needs a steady state environment which is largely provided by the neurovascular unit. In this respect changes in functions of the neurovascular unit have important consequences in causing or aggravating a large number of neurological diseases. The main goal of our research is to understand the molecular mechanisms underlying the function of the neurovascular unit under physiological and pathological conditions. For this purpose, we use different *in vitro* models and *in vivo* two-photon microscopy. On the one side, we investigate the role of neurovascular unit in the formation of brain metastases and the mechanisms of migration of tumour cells into the brain. On the other hand, we investigate how cellular components of the neurovascular unit (brain endothelial cells, pericytes, astrocytes) communicate with each other in neurological disorders associated with aging and with inflammatory processes.

TECHNIQUES AVAILABLE IN THE LAB

Isolation of different cell types from mammalian brain, cell culture, *in vitro* model systems including disease models, barrier permeability studies, biochemical and molecular biology methods, ELISA, fluorescence and confocal microscopy, *in vivo* two-photon and superresolution (STED) microscopy.

TAMÁS MARTINEK

Department of Pharmaceutical Analysis
University of Szeged

Address: Somogyi u. 4., H-6725 Szeged, Hungary

RESEARCH AREA

The aim of our research group is to create new macromolecules from unnatural building blocks (foldamers), of which 3D structure can be predicted and programmed. Manipulating protein-protein, protein-membrane and protein-carbohydrate interactions by these chemically well defined substances is a great challenge and holds promise. While small molecule drugs can not effectively decouple macromolecule interactions in general because of their geometry, the right sized and often used antibodies have many disadvantages. We utilize foldamers as artificial self-organizing protein mimetics to modulate protein interactions, to develop diagnostic tools and novel antibacterial materials.

TECHNIQUES AVAILABLE IN THE LAB

Foldamers are synthesised chemically by using automated methods and the desing heavily relies on computer modelling. Their structure is analyzed by HPLC-MS. To analyze protein-ligand interactions, NMR spectrometry is deployed with a special emphasis on protein NMR methods including 3D structure refinement and the analysis of protein dynamics. Proteins are produced via bacterial expression systems. We analyze protein – ligand interactions with the help of isothermal titration calorimetry and various fluorescent techniques. Biological activity of the compounds are tested in cell-based assays.

RESEARCH AREA

Cancer is the leading cause of death in the developed world. According to estimates from the International Agency for Research on Cancer, there were 8.2 million cancer deaths in 2012 worldwide.

Cancer research began as early as at the end of the 19th century, indicating the social efforts to control this devastating disease. In recent years, the tremendous advances reached in molecular biology and genomics has given further impetus to the development of this field. Among other things, the recently developed high-throughput sequencing technology platforms have generated massive amounts of genetic variation data from a huge number of cancer samples. The collected data support the concept that cancer is a disease of our genome, because in the majority of tumors tens or even hundreds of thousands of mutations have been detected. These data also show that the spontaneous mutation rate observed in normal cells is not sufficient to account for the high number of mutations found in cancers. The key feature of cancer cells, allowing them to rapidly evolve more and more new mutations, is the instability of their genetic material.

The long-term objective of our laboratory is to explore genetic alterations fuelling malignant transformation by undermining the stability of the genome.

TECHNIQUES AVAILABLE IN THE LAB

Basic molecular biological methods, involving isolation manipulation and analysis of DNA, RNA and proteins, standard mammalian tissue culture techniques, basic mouse colony management techniques, gene knockout and gene knockdown techniques, advanced gene delivery methods used in tissue culture and in animal models.

RESEARCH AREA

Coordinated regulation of the actin and microtubule cytoskeleton is known to play a pivotal role in the growth and proper navigation of neuronal axons and dendrites that are necessary to the formation of a functional nervous system. One of our major scientific interests is to gain a better understanding of the molecular mechanisms of axonal growth and guidance by uncovering the role of the growth cone cytoskeleton regulatory proteins. In addition, we are interested in the mechanisms of myofibrillogenesis. Myofibrils are composed of repeated sarcomeres that are extremely highly ordered macromolecular assemblies where structural organization is intimately linked to their functionality as contractile units. Recently, we developed a powerful nanoscopic approach that allowed us to determine the position of 27 muscle proteins with a quasi-molecular localization precision, and by means of template based protein structure modelling, we assembled a refined I-band and H-zone model with an unparalleled scope and resolution. We aim to combine this method with genetic approaches to investigate the molecular mechanisms of sarcomere assembly during muscle development.

Our studies are of potential biomedical relevance as they may help to develop more efficient neuronal regeneration methods, and to understand sarcomere assembly and function in healthy and disease conditions.

RESEARCH AREA

We focus on bacterial pathogens and the problem of antibiotic resistance. We found that multidrug resistance mutations in bacteria simultaneously enhance sensitivity to other unrelated antibiotics (collateral sensitivity). This finding has led to the design of new antibiotic cocktails. Using bacterial genome engineering, we aim to develop novel resistance-free antibiotics. Finally, we study the evolution of adaptive immune system in response to pathogens and cancer.

RESEARCH AREA

Metabolism is central to life as it provides the building blocks and energy for all biological processes. While its fundamental tasks are highly conserved across all life forms, there are substantial differences in the details of how metabolism works across species and individuals. Humans are no exception. Any two of us show large metabolic differences and many diseases are known to involve changes in metabolism. However, not all metabolic differences are harmful and identifying those that impact human health is of paramount importance for medicine. Our laboratory uses computational approaches to study the variation of metabolism both within human populations and between different species. Our goal is to uncover the signatures of natural selection acting on human metabolism and thereby increase our understanding of healthy and diseased states.

RESEARCH AREA

The cardiopulmonary research laboratory performs scientific activities in various fields of cardiopulmonary physiology and pathophysiology by using translational animal models of lung diseases and performing assessments in clinical environment. A research area is focusing on the involvement of the pulmonary hemodynamics and lung vasculature in various respiratory diseases. We clarify the mechanisms responsible for the lung function deteriorations with a particular focus on the cardiopulmonary interactions. Further research focuses on the characterization of the pulmonary consequences of general anesthesia in various animal models and in clinical environment. Improvement of patient monitoring is essential for the optimization of patient management in anesthesia and intensive care settings. Analyses of the expired gases has great importance in respiratory patient monitoring. Thus we analyze the within-breath dynamics of CO₂ exhalation by using capnography to gain insights into the ventilation-perfusion matching. Further research focuses on the pulmonary manifestations of type-2 diabetes mellitus (T2DM) that presents major public health concerns. We characterize the changes in airway function and clarify the deteriorations in the viscoelastic properties of the pulmonary parenchyma, which may be a consequence of lung volume loss, interstitial edema, proliferation, and the effect of advanced glycation endproducts and their interaction with receptors.

TECHNIQUES AVAILABLE IN THE LAB

- Measurement methodologies for the assessment of lung mechanics in animal models and in clinical environment involving spontaneously breathing subjects and anesthetized mechanically ventilated patients.
- Techniques for circulatory and respiratory monitoring.
- Models of airway hyperresponsiveness.
- Inhalation of airborne nanoparticles: exposition and measurement methods.
- Analyses of expired gases, evaluation of the dynamics of expired CO₂ concentration with capnography, oxygraphy.

- Assessment of pulmonary consequences of diabetes mellitus in animal models and patients.
- Near infrared spectroscopy for the assessment of cerebral tissue oxygen saturation.
- Assessment of perioperative hemostasis.

Biological Research Center

Address: Temesvári krt. 62., H-6726 Szeged, Hungary

RESEARCH AREA

The saying originating from the US at the beginning of the previous century “A picture is worth a thousand words” is particularly adequate for the description of the complexity of the brain. A new discipline, called geometrical statistics, is used now by micro-anatomical photography to derive unbiased data characterizing the number, size, specified surface portions, etc. of nerve cells by using tiny samples from an enormously high population (≈ 200 billion) of neurons constituting the brain.

The results of such investigations either may contribute to the interpretation of the industrial amount of data coming from (sometimes) automated molecular biology instruments, or may substitute those, when variations of biological functions should be attributed to distributional instead of quantitative changes in e.g. gene expression. The development of biological micro-structural investigations is undoubtedly motivated by a typical human desire expressed by “seeing is believing”. This is most obvious in the regular need of seeking the structural correlates of the results obtained by another cutting edge technology, electrophysiology.

Our micro-anatomical research is aimed to derive quantitative data characterizing nerve cells in healthy conditions, during disease and ageing, which are also suitable to measure the effect of treatments aimed to halt or reverse disease progression.

TECHNIQUES AVAILABLE IN THE LAB

Basic methods in structural investigations (light, fluorescent, and electron microscopic techniques), sample preparation methods for biological structural research, labeling techniques for molecular imaging, statistical basis of sampling for unbiased quantitative microscopy, derivation of biological relevant three-dimensional parameters from biological tissue, interactive and automatic computer assisted image analysis, image analysis programming languages.

MÁRTA SZÉLL

Institute of Medical Genetics and the
Dermatological Research Group

Address: Somogyi B. u. 4., H-6720 Szeged, Hungary

RESEARCH AREA

The genome programs of the past decades have provided an enormous amount of information about the human genome and how this information is translated to the “language of life”. This knowledge is essential for understanding the pathogenesis of human diseases at the molecular level and, in fact, is currently being used to develop novel diagnostics and therapeutic modalities. Our workgroup identifies novel pathogenic mutations that result in rare monogenic human diseases. By performing functional analyses of these mutations, we attempt to understand how their mode of action leads to human disease. In another project, we investigate the genetics and molecular susceptibility factors of multifactorial human skin diseases, with a primary focus on psoriasis. We are also engaged in the investigation of non-coding RNAs. In particular, we analyze the role of the PRINS mRNA-like non-coding RNA, which was previously identified by our workgroup, in cellular stress responses and in various human diseases. In the last few years our research group has joined the Hungarian Brain Research Program (NAP Project) and as the member of the clinical branch we are engaged in the identification of genetic factors in neurodegenerative human diseases. This work has already yielded several new results for the field.

TECHNIQUES AVAILABLE IN THE LAB

After identifying mutations using the polymerase chain reaction (PCR) and sequencing methods, various bioinformatics tools are used for sequence analysis. For our functional analyses, we employ *in vitro* DNA and cloning techniques as well as specific gene-silencing methods. Gene and protein expression is assessed using real-time reverse transcriptase PCR, western blot analysis, immunohistochemistry and immunocytochemistry. In the last few years we have introduced next generation sequencing (NGS) into our laboratory and we apply it routinely in our research work. Data provided by NGS are analyzed by various bioinformatics tools.

RESEARCH AREA

Our research is characterized by a combination of technically challenging electrophysiology, molecular biology, imaging and anatomy in pursuit of the function of cell types and their synapses in the human and rodent cerebral cortex. We discovered the cellular source (neurogliaform cells) of slow, GABAB receptor mediated inhibition in the cerebral cortex. Subsequently, we discovered the mechanism of this slow inhibition as single neuron driven nonsynaptic or volume transmission of the neurotransmitter GABA. In addition, our experiments assigned a new, excitatory role to axo-axonic cells, which were considered as the most specific inhibitory neurons of the cortex. Our commitment to cutting edge methodology recently resulted in recordings from identified interneurons in completely unaesthetized, freely behaving rodents and identified the first ripple-like oscillatory events in the neocortex and their cellular structure. We initiated a research program in 2004 for multiple patch clamp recordings in slices taken from the human cerebral cortex leading to the first recordings of human synaptic interactions and showing the existence of Hebbian networks in the human cerebral cortex.

TECHNIQUES AVAILABLE IN THE LAB

In vivo juxtacellular recordings from neurons of the cerebral cortex in freely behaving rodents, *in vivo* patch clamp electrophysiology, human *in vitro* brain slice patch clamp electrophysiology, *in vivo* and *in vitro* multiphoton imaging (acoustooptical and resonant scanning), CARS microscopy in brain slices, transmission electron microscopy, 3D neuron reconstruction with Neurolucida, single digital PCR, single and oligocellular next generation sequencing.

RESEARCH AREA

Genome integrity is crucial for all living organisms. If damaged DNA is not promptly repaired, the mutations ultimately lead to the development of cancer. Defective repair can also cause immunodeficiency, neurodegenerative disorders and premature ageing. The range of DNA lesions require diverse signaling and repair pathways to shape the DNA damage response. This involves changes in nuclear dynamics including alterations in chromatin structure, nucleocytoplasmic transport and protein activities.

ADP-ribosylation is one of the earliest post-translational modifications appearing upon DNA damage. Its effects are numerous. One of its functions is to relax chromatin at the sites of DNA damage, facilitating the access of DNA repair processes to the lesions. Our findings indicate that nuclear dynamics, mRNA metabolism and chromosome organization strongly depend on nuclear ADP-ribosylation reactions and their crosstalk with other signaling pathways. Its deregulation impairs DNA repair and is implicated in cancer. At the bedside, the inhibition of ADP-ribosylation by drugs is used to treat cancer with certain gene mutations.

Our research goal is to characterize novel molecular mechanisms that regulate the DNA damage response, including nucleocytoplasmic transport, mRNA metabolism and chromatin architecture. We study novel cancer relevant mutations that are sensitive to ADP-ribosylation inhibitors, which could be potentially used to treat tumors carrying such mutations. Furthermore, we investigate the molecular basis of a novel DNA damage-induced nuclear export mechanism that regulates ADP-ribose metabolism.

TECHNIQUES AVAILABLE IN THE LAB

Molecular biology techniques for DNA, RNA and protein production, isolation and measurement, PCR, qPCR, cloning, sequencing, *in vitro* mutagenesis, Western blot, immunohistochemistry, cell culture methods, cell-based reporter assays to measure DNA repair, ADP-ribosylation, chromatin structure or protein-protein interaction, confocal microscopy, live cell imaging of fluorescently tagged proteins, knocking out or silencing genes in human cells, CRISPR-based whole genome knockout screening.

RESEARCH AREA

Sudden cardiac death is among the leading causes of mortality worldwide. Therefore to better understand the mechanisms of sudden cardiac death and consequently to introduce effective preventive measures represent extremely important issues in the field of public health care. Sudden cardiac death may occur due to cardiac ischaemia, adverse reaction following drug treatment is associated with diseases like heart failure, congenital diseases or can develop in top athletes due to excessive exercise and/or doping. These cases can manifest due to electrophysiological malfunctions of the heart as a consequence of disturbances in cardiac transmembrane ion channel function including various types of potassium channels. Our research team focuses on investigations on the physiology and pathophysiology of these ion channels including pharmacological modulation and possible prevention of cardiac arrhythmias in general, achieving international attention worldwide.

TECHNIQUES AVAILABLE IN THE LAB

Basic cardiac electrophysiological and molecular biological methods, such as *in vivo* arrhythmia models, cellular action potential measurements, patch-clamp techniques, epifluorescent Ca^{2+} signal detection, gene transfer, PCR and Western Blot techniques.

University of Szeged

Address: Semmelweis u. 6., H-6720 Szeged, Hungary

RESEARCH AREA

Our main research interest is the experimental and clinical investigation of the pathomechanism and possible therapeutic targets of neurological diseases. With the aid of MR imaging and electrophysiological recordings we search for the characteristic features of multiple sclerosis, Alzheimer's disease, Parkinson's disease and given headache disorders. From cerebrospinal fluid and from blood samples we determine biomarkers, which could help the diagnosis confirmation and provide details about the course of the diseases. In genetic studies, we investigate the genetic background of multiple sclerosis and Parkinson's' disease. The foundation of these experiments is our Biobank of human tissue samples, which we collect continuously.

In our animal models we examine the molecular background of neurological disorders, particularly the protective effects of kynurenic acid derivatives. The kynurenine system is our main research target, which is involved in the pathomechanism of numerous neurological disorders due to the modulatory effects on glutamatergic neurotransmission. In previous experiments, these molecules were effective in the experimental models of headache, Huntington's disease, epilepsy and stroke. Our aim is to further elucidate the mechanisms of effect and potential therapeutic value of this molecules.

TECHNIQUES AVAILABLE IN THE LAB

MR imaging and data processing, clinical electrophysiological recordings, transcranial direct/alternating current stimulation, RNA and DNA isolation, different PCR and ELISA methods, immunohistochemistry, Western blotting, behavioral experiments on animals, HPLC.

RESEARCH AREA

As a “central dogma” earlier it was suggested that stress-induced protein denaturation serves as a major stress-sensing machinery, which triggers the expression of the molecular chaperone heat shock proteins (HSPs). We have introduced a new but not exclusive cellular “membrane thermosensor” model, which predicts the existence of membrane-associated stress sensing and signaling mechanisms. It proposes that changes in the physical state and composition of lipid molecular species with the concomitant destabilization/reorganization of membrane microdomains (“rafts”) can serve also as “molecular switches” to operate “cellular thermometers”. Using mammalian cells and the fission yeast (*S.pombe*) as models we intend to elucidate the mechanism of membrane-associated stress sensors, signaling pathways and the interplay and networking of potential cellular stress survival strategies. Since HSPs play a fundamental role in the pathology of several human diseases, understanding the mechanism whereby mammalian cells can elicit a stress response may also be of paramount importance for the design of novel drug molecules.

TECHNIQUES AVAILABLE IN THE LAB

Classical biochemical and molecular biology methods. Membrane biophysics: spectroscopy, Langmuir monolayers, ultrasensitive fluorescence microscopy, single molecule tracking, image analysis. Lipidomic analysis: chromatographic and mass spectrometry techniques. Multidimensional data analysis, statistical methods.

RESEARCH AREA

Proteins are polypeptide chains characterized by unique amino acid sequences (primary structures) and specific secondary and tertiary three dimensional structures. They are the key players in many biophysical, biochemical and physiological processes. (*Nota bene*, many intrinsically disordered proteins have recently been discovered whose functional form lacks any defined 3D structure...). In many cases the presence of non-amino-acid cofactors is also essential for the protein's function. Typical examples are the proteins excited by visible light (e.g. in visual perception and light sensing), or certain electron transport – so called redox – proteins, such as the cytochromes, that are also colored. In our research group we study such “colorful” proteins, their properties, function, physiological roles, taking advantage of the fact that the structural changes accompanying their function can usually be followed by measuring their color changes using static or kinetic (rapid time-resolved) absorption spectroscopy. The colored (possessing chromophores) or the redox proteins may exhibit interesting or useful properties not only in their natural physiological environment but also in very different artificial environments. One can envisage biophotonics or bioelectronics applications from the appropriate interfacing of certain proteins with photonic crystals or semiconductor materials. Hence we also study the interactions of porous silicon based photonic crystals (periodic structures commensurate with the wavelength of light) and select proteins.

TECHNIQUES AVAILABLE IN THE LAB

Expression and purification of proteins, static and kinetic spectroscopies, electrochemical technique (voltammetry), preparation and functionalization of porous silicon photonic samples, control of pulsed laser laboratory, Matlab programming language.

Cardiopulmonary Research Group

Address: Korányi fasor 9, H-6720 Szeged, Hungary

RESEARCH AREA

Changes of the cardiovascular system also affect the respiratory system via heart-lung interactions. Our research group aims at characterizing mechanical and functional parameters of the respiratory system both in animal models and human subjects. Our research area includes the investigation of respiratory effects of various diseases (e.g. diabetes mellitus), interventions (e.g. blood loss or cardiopulmonary bypass), or drugs affecting the cardiovascular system or other, primarily respiratory diseases. Our research has a focus on the investigation of the respiratory effects of various, anaesthesia-related drugs, interventions, diseases. Our methods include a unique characterization of respiratory mechanical parameters with the use of the forced oscillation technique and measurement of partial pressure of exhaled carbon-dioxide (capnography).

TECHNIQUES AVAILABLE IN THE LAB

Participation in animal experiments, surgical methods, performing measurements and analysis of respiratory mechanical parameters, recording and analysis of vital parameters. Data analysis methods (R programming language), statistical analysis of data. Students can also participate in human experiments of the research group.

TÍMEA GONDA

University of Szeged
Institute of Pharmacognosy

Address: Eötvös u 6, H-6720, Szeged, Hungary

RESEARCH AREA

Cancer is the second leading death cause globally, and is responsible for nearly 10 million deaths in 2018. The application of conventional anti-cancer drugs is often limited by their excessive undesirable side-effects. One of the biggest unresolved challenges in cancer therapy is to maximize damage on cancer cells while minimizing toxicity in normal cells. A recently emerged potential solution would be the selective inhibition of ATR kinase, a protein crucial for the survival of cancer cells. Our research group aims to contribute to the state-of-art knowledge in this research area with the synthesis of structurally diverse compound libraries potentially exerting ATR kinase inhibitor activity. Investigation of the antitumor activity of the prepared compounds is performed in collaboration, followed by the assessment of structure-activity relationships and the optimization of the compound structures.

TECHNIQUES AVAILABLE IN THE LAB

A wide array of synthetic organic chemistry and spectroscopic analytical methods (NMR, MS) are available. The reactions are followed by thin layer chromatography and analytical HPLC, while for the purification of the prepared compounds diverse separation techniques are available: preparative HPLC, supercritical fluid chromatography, flash chromatography, column chromatography, rotational planar chromatography and centrifugal partition chromatography.

PETRA HARTMANN

University of Szeged
Institute of Surgical Research

Address: Pulz utca 1., H-6724 Szeged, Hungary

RESEARCH AREA

Previous studies constructed a comprehensive picture on the biological effects of exogenous methane (CH₄) in various ischemia-reperfusion (IR) and inflammatory settings. However, the underlying mechanisms are still not known with certainty; and the immediate challenge is therefore to test hypotheses to understand the background of CH₄-induced reactions. Our main purpose is to examine the effects of CH₄ on possible cellular and subcellular targets, including mitochondria and to apply CH₄ in complex, *in vivo* animal models of IR, focusing on specific organ functions.

TECHNIQUES AVAILABLE IN THE LAB

In vivo animal models (rodents and large animals), *in vivo* imaging techniques with fluorescent laser-scanning endomicroscopy or intravital microscopy. Microcirculatory measurements with orthogonal polarization spectral imaging and laser-Doppler. *Ex vivo* organ perfusion systems (liver, kidney) for static and dynamic graft preservation. Measurement of mitochondrial respiration, hydrogen-peroxyde production and membrane potential using high-resolution respirometry and its fluorescent moduls (Oxygraph2k). Basic laboratory techniques (spectrophotometry, isolation of mitochondria).

RESEARCH AREA

DNA repair mechanisms are required for the correction of DNA damage occurring during normal cellular life or due to physical or chemical agents. The process of autophagy is responsible for the recycling of damaged cellular components. There are evidences that the two processes are interconnected, they may regulate each other. For example Fanconi anemia genes were shown to have essential role in two forms of selective autophagy, their mitophagy function is genetically distinct from their role in genomic DNA damage repair. BRCA1 and BRCA2 are also required for mitophagy, moreover BRCA1 negatively regulates formation of autophagosomes and lysosomal mass.

We examined changes in markers of DNA Double Stranded Breaks and general autophagy in response to different treatments (autophagy induction or block) in HEK293 human cell lines silenced for different DNA repair genes in order to evaluate which of them may have a function in autophagy regulation. The role of BRCA1 and BRCA2 in the downregulation of the formation of autolysosomes in MCF-7 breast cancer cells is also under investigation.

TECHNIQUES AVAILABLE IN THE LAB

Molecular biology techniques: cloning, DNA/RNA preparation and quantitation (DeNovix spectrophotometer), different PCR techniques. Recombinant protein expression and purification. Western blot analysis with Li-Cor ODYSSEY Blot Imager using Image Studio 5.2 software. Cell culture techniques, cell transfection, immunocytochemistry, fluorescent microscopy, confocal microscopy.

RESEARCH AREA

Functional and morphological changes within mitochondria and their altered interaction with other organelles are suggested to play a critical role in the pathogenesis of various diseases associated with life-threatening organ dysfunction. Some of them, such as sepsis and ischaemia/reperfusion-induced injury (I/R) have more recently become an intensively developing field of basic research. Our main purpose is to investigate the underlying mitochondrial and cellular mechanisms involved in the corresponding animal model of diseases.

TECHNIQUES AVAILABLE IN THE LAB

Preparation of intact mitochondria/tissue homogenates from various tissues/organs of laboratory animals (e.g., liver, small intestine and kidney), evaluation of cellular respiratory function and states using high-resolution respirometry (OROBOROS O2k), simultaneous monitoring of changes in mitochondrial membrane potential (safranin fluorescence), mitochondrial reactive oxygen species (HRP/Amplex UltraRed assay) and calcium-flux (Calcium Green-5N fluorescence). Assessment of oxidative and nitrosative stress markers.

RESEARCH AREA

DNA double-strand breaks (DSBs) are among the most severe types of genomic damage threatening cellular viability. They can be repaired by two major pathways: canonical non-homologous end-joining (c-NHEJ) and homologous recombination (HR).

One of the earliest events upon DNA damage is the recruitment and activation of poly(ADP-ribose) polymerase 1 (PARP1), a key regulator of the DNA damage response. PARP1 is a DNA damage sensor and signal transducer that synthesizes negatively charged, branched poly(ADP-ribose) chains (PARYlation) on target proteins. PARYlation facilitates the recruitment of DNA repair factors and chromatin remodeling enzymes around damaged DNA. A little over a decade ago, it was discovered that BRCA1 and BRCA2 defective tumors can be specifically killed by PARP inhibitors (PARPi). This synthetic lethality had great premise in oncology because carriers of deleterious heterozygous germline mutations in the BRCA1 or BRCA2 genes have a high risk of developing breast and ovarian cancers. Regulatory bodies including FDA and EMA have recently accepted PARPi to be used in ovarian cancer patients with BRCA1 or BRCA2 mutations. Today, more than one PARP inhibitor is approved for cancer therapy.

PARP inhibitors drive synthetic lethality in two, not necessarily exclusive ways: interfering with DNA damage repair or trapping PARP on DNA. Both PARP1 and BRCA2 play an important role in restarting stalled replication forks. Furthermore, the loss of 53BP1 in BRCA1 mutant cells alleviates hypersensitivity to PARP inhibitors and restores HR suggesting a role for PARP1 in regulating the choice between HR and NHEJ DNA repair pathways. Activated PARP1 strongly PARYlates itself, which facilitates its own release from the damaged DNA, hence, the release of drug-inhibited PARP1 is hindered. In our studies we identify new factors that can modulate the PARPi-mediated synthetic lethality in human cells. We characterize these factors in classical molecular biology assays that can provide data to extend the therapeutic spectrum of PARP inhibitor treatment.

TECHNIQUES AVAILABLE IN THE LAB

Techniques for vertebrate cell lines including generation of KO cell lines with CRISPR, Western blot, co-immunoprecipitation assay, Southern blot, chromosome preparation, chromatin fractionation, immunostaining, laser microirradiation assay, micropore irradiation assay, SNAP-system for protein repopulation, measuring of the DNA repair kinetics, live cell imaging of fluorescently tagged proteins. In vitro techniques including recombinant DNA technology, protein purification and pull-down assays.

RESEARCH AREA

Skeletal muscle is a highly dynamic tissue that can undergo successful regeneration upon injury, and change in size in response to exercise, aging or due to diseases (e.g. cancer cachexia, immobilization, or denervation). The muscle stem cells, satellite cells are stimulated by local damage to proliferate extensively and form myoblasts that will subsequently migrate, differentiate and fuse to form muscle fibers. Our research aims are to study (i) the signaling pathways and mechanisms in myoblast migration, differentiation, and fusion (ii) the role of exosomes in cell migration, (iii) the biology of satellite cells. Moreover, we investigate the molecular mechanisms regulating skeletal muscle mass, and we aimed to find new nanotechnological approaches for the local treatment of muscle atrophy. Skeletal muscle has an important role in whole-body metabolism, it accounts for 40% of adult human body weight, and about 90% of insulin-stimulated glucose uptake occurs in skeletal muscle. The vesicular transport of GLUT4 glucose transporters is impaired in cases of insulin resistance and type-2 diabetes mellitus leading to decreased glucose uptake of skeletal muscle and increased blood glucose level. Our further aim is to study this mechanism and to find new signaling pathways regulating glucose uptake of skeletal muscle. Our work is mainly basic research and we have strong scientific collaborations with clinicians.

TECHNIQUES AVAILABLE IN THE LAB

Mammalian tissue culture techniques, *in vivo* animal models, primary cell isolation, single myofiber and satellite cell isolation, immunocytochemistry, immunohistochemistry, fluorescent microscopy techniques, image analysis, analysis of cell migration, flow cytometry, cell cycle analysis, cell proliferation assays, spectrophotometry (measurement of enzyme activities, metabolites), PCR, co-immunoprecipitation, GTP-ase activity assays, Western blotting, glucose tolerance test, insulin tolerance test.

MÁTÉ MANCZINGER

University of Szeged
Department of Dermatology and Allergology

Address: Korányi fasor 6., H-6720 Szeged, Hungary

RESEARCH AREA

The immune system has to differentiate between harmful and non-harmful agents. Inadequate immune recognition can lead to infectious diseases, allergy, autoimmunity and cancer.

We examine the adaptive immune recognition and its role in different diseases. We are focusing on MHC molecules, which are essential elements of this process by presenting short peptide fragments to immune cells. The genes encoding these molecules show extreme genetic variability, which means that two individuals rarely carry the same MHC variants.

During our work, we analyze large datasets to reveal general features of MHC molecules, which make people susceptible to different diseases.

TECHNIQUES AVAILABLE IN THE LAB

Programming in "R" language; big data analysis; modern statistics; database processing, data visualization.

TAMÁS MARUZZS

Biological Research Centre

Address: Temesvári krt 62., H-6726 Szeged, Hungary

RESEARCH AREA

Organelles of eukaryotic cells represent an intricate network the members of which are connected with each other either via vesicular transport processes or permanent physical contacts. Significance of the latter type of organellar communication (the so-called membrane contact sites) has only been recognized in the last decade. The complex, dynamic endomembrane system plays a pivotal role in normal cell physiology and its proper function requires the concerted action of several proteins. Main research focus of our group is the investigation of genes and proteins involved in vesicular trafficking routes channelling to the lysosomes, the central degradative organelles of cells. Members of the Sorting nexin (Snx) protein family play important roles in numerous points of the endolysosomal system. All Snx proteins contain the lipid-binding PX-domain that enables them to associate with organellar membranes where they utilize other protein domains to take part in versatile molecular events. However, exact cellular functions of many Snx proteins are currently unknown, and importantly, some of these proteins are involved in the pathogenesis of human diseases. Most of the Sorting nexins are evolutionarily conserved, offering the possibility to investigate their functions in model organisms. We use various fruitfly tissues to study the molecular functions of the less well-characterized Snx proteins in the endolysosomal system. Our current focus is on the investigation of the function of Snx25, a known membrane contact site protein, which is involved in a human hereditary neurodegenerative disease. Our results show that the mutation of the fruitfly counterpart of this gene leads to severe defects in the endosomal maturation process of the highly endocytic larval nephrocytes. However, the exact mechanism of this phenomenon is currently not known.

TECHNIQUES AVAILABLE IN THE LAB

To explore Sorting nexin functions in the endolysosomal system, we primarily use light-microscopy techniques (fluorescent immunohistochemistry and other labeling methods). In our research we exploit the genetic and cell biology toolkit of the fruitfly (*Drosophila melanogaster*), the model organism with a history of more than a hundred

years. Beside larval nephrocytes, we use other fruitfly tissues (e.g. larval fat body and salivary gland) as well to analyze the endolysosomal network. Routine molecular biology approaches (cloning and protein detection methods etc.) are also used mainly in order to generate new genetic tools (mutant and transgenic animals).

ÁKOS MENYHÁRT

University of Szeged
Department of Medical Physics and Informatics
Group of Cerebral Blood Flow and Metabolism

Address: Korányi fasor 8-10, H-6720 Szeged, Hungary

RESEARCH AREA

Glutamate excitotoxicity and cellular calcium overload stand in the background of various neurological disorders such as cerebral stroke, traumatic brain injury, epilepsy or Parkinson's disease. While neurons are highly sensitive to ischemic injury, their more resistant protectors, astrocytes are essential to restore glutamatergic signaling to the physiological range. Astrocytes modulate neural excitability and minimize brain damage through spatial buffering of extracellular K⁺ and clearance of surplus neurotransmitters. The most important trait of astrocytes is probably the formation of an anatomical and functional "syncytium", a network created by cells attached to each other to communicate by gap junctions (GJs). The anatomical continuity of the main GJ proteins; Cx43 and Cx30, is essential to/for the formation of the functional syncytium of astrocytes. Phosphorylation of Cx43 essentially reduces the conductance of GJs, and thereby affects interastrocytic communication by altering gating and trafficking properties of the channels.

Spreading depolarization (SD) is a slowly propagating wave of neuronal and glial depolarization that occurs in the injured brain and contributes to lesion expansion after ischemic stroke. We have recently found impaired extracellular potassium clearance during spreading depolarization under simulated ischemic conditions. According to our working hypothesis; SD causes CX43 phosphorylation, reduces astrocytic spatial buffering capacity, and impairs glutamate clearance and excitotoxicity in the ischemic brain. Therefore, the major goals of our research are;

1. To demonstrate that astrocyte Cx43 phosphorylation co-occurs with impaired spatial buffering and glutamate clearance in global cerebral ischemia;
2. To improve cellular viability and achieve better outcome from cerebral ischemic injury.

TECHNIQUES AVAILABLE IN THE LAB

Application of the Biopac© and LabChart© systems for data acquisition and analysis, basic experimental surgical techniques, electrophysiology (DC potential and EEG recording, measurement of pH and extracellular potassium concentration in the nervous tissue), experimental microsurgery, image analysis, in vitro brain slice preparation, intrinsic optical signal analysis, laser Doppler flowmetry, laser-speckle contrast imaging of local cerebral blood flow, pharmacology, statistical methods, computer programming (MATlab) voltage-sensitive and pH-sensitive dye imaging of cellular trans-membrane potential.

University of Szeged
Department of Physiology, Anatomy and Neuroscience
MTA-SZTE Research Group for Cortical Microcircuits

Address: Közép fasor 52., H-6726 Szeged, Hungary

RESEARCH AREA

Since the beginning of modern neuroscience it is a primary desire to understand the human cerebral cortex. How neurons build up networks and how they are able to serve higher brain functions such as cognition, complex perception, decision-making or language is still a mystery yet to be solved. The research of human brain mainly approached with noninvasive low resolution brain-imaging technologies or scalp electrode based techniques. We still are missing the information on the intricate organization of human neuronal networks. To date substantial data have been acquired from animal models investigating the physiological mechanisms. However, research on human neural circuits are more challenging due to lack of suitable tissue. Human neurons are not "scaled-up" versions of rodent or primate neurons, but have unique structural and functional properties. Our results, apart from deepening our understanding of basic features and mechanisms neuronal circuits and connections, can also provide a basis for development of proper therapies for neurodegenerations.

TECHNIQUES AVAILABLE IN THE LAB

We are using cutting edge neurophysiological and imaging techniques e.g. *in vivo* patch clamp electrophysiology, human *in vitro* brain slice patch clamp electrophysiology, *in vivo* and *in vitro* multiphoton imaging (acoustooptical and resonant scanning), CARS microscopy in brain slices, transmission electron microscopy, 3D neuron reconstruction with Neurolucida, image processing, coding and statistics.

NORBERT NAGY

University of Szeged
Faculty of Medicine
Department of Pharmacology and Pharmacotherapy

Address: Dóm tér 12., H-6720 Szeged, Hungary

RESEARCH AREA

The cardiac electrophysiology investigates the electrical changes of heart, implying both the physiological and pathological functions as well as novel pharmacological interventions. The cardiovascular diseases, and especially the arrhythmias are leading cause of mortality. The arrhythmias have a complex underlying mechanism where the intracellular Ca^{2+} handling play a critical role. Therefore, the main aim of our laboratory is the investigation of the physiological function of the cardiac Ca^{2+} handling, its role in different arrhythmias, and possible pharmacological interventions.

A novel antiarrhythmic strategy could be the selective inhibition of the cardiac $\text{Na}^+/\text{Ca}^{2+}$ exchanger that may decrease the excessive Ca^{2+} load of the cell, furthermore may have positive inotropic effect.

The sinus-node as a primary rhythm generator of the heart has an extremely complex electrophysiological mechanism, at the same time, it could be involved in several types of arrhythmias. Our further aim is the investigation of the Ca^{2+} handling in sinus-node cells under normal as well as during pathological condition (e.g.: metabolic syndrome).

It is well-known that physical activity is healthy and significantly contributes to the normal physiology of the cardiovascular system. Still, several times sudden cardiac death of competitive athletes was observed where organic disease of the heart was not found. The underlying mechanism of sudden death could be the abrupt disturbance of the normal electrophysiological function of heart, however the arrhythmia mechanism is unknown. Therefore, further aim of our Institute is to develop a reliable "athlete's heart" animal model that provide data regarding the electrophysiological changes during physical activity.

TECHNIQUES AVAILABLE IN THE LAB

Isolation of cardiac myocytes. Measurement of action potentials from cardiac tissue with standard microelectrode technique. Combined ionic current and Ca^{2+} movement measurement by patch-clamp technique associated with fluorescent optical method from isolated ventricular and sinus node cells. Analysis and interpretation of the data

RESEARCH AREA

Our research group's aim is to identify the genomic causes of rare genetic disorders. Rare disease affects a small percentage of the population; its prevalence is less than 1:2000. However, taking all rare diseases together, many individuals and families are affected. To date, there are more thousands of known rare disease. They cause a large health burden to the individuals and families. 80% of rare diseases have genetic component and they are very diverse. Our research group mainly focuses on genodermatoses, neurodegenerative diseases, cardiovascular diseases, rare inheritable eye diseases, inherited hearing loss and congenital developmental abnormalities. Our findings help to understand the genetic background of rare genetic disorders and to expand human mutational databases related to human inherited diseases. This knowledge is essential for understanding the pathogenesis of human diseases at the molecular level and it can be also useful to develop novel diagnostics and therapeutic modalities. Our results may provide a good basis to develop Hungarian population-specific test panels in different inherited diseases.

TECHNIQUES AVAILABLE IN THE LAB

We apply a wide range of laboratory methods, including classical and new ones. The regularly used methods are the following: polymerase chain reaction (PCR) and sequencing methods combined with various bioinformatics tools for sequence analysis. DNA extraction from blood and tissue samples, DNA quantitation, primer design, different PCR techniques such as standard, Repeat-Primed PCR, Real-Time PCR, Digital Droplet PCR, agarose gel electrophoresis, Sanger sequencing and amplicon fragment length analysis, next generation sequencing (gene panel and whole exome sequencing) and bioinformatics analysis of these data. We use clinical and mutational databases and *in silico* variant predictions for variant interpretation and also provide genotype-phenotype comparison.

RESEARCH AREA

The saying originating from the US at the beginning of the previous century “*A picture is worth a thousand words*” is particularly adequate for the description of the complexity of the brain. A new discipline, called geometrical statistics, is used now by micro-anatomical photography to derive unbiased data characterizing the number, size, specified surface portions, etc. of nerve cells by using tiny samples from an enormously high population (≈ 200 billion) of neurons constituting the brain.

The results of such investigations either may contribute to the interpretation of the industrial amount of data coming from (sometimes) automated molecular biology instruments, or may substitute those, when variations of biological functions should be attributed to distributional instead of quantitative changes in e.g. gene expression. The development of biological microstructural investigations is undoubtedly motivated by a typical human desire expressed by “*seeing is believing*”. This is most obvious in the regular need of seeking the structural correlates of the results obtained by another cutting edge technology, electrophysiology.

Our micro-anatomical research is aimed to derive quantitative data characterizing nerve cells in healthy conditions, during disease and ageing, which are also suitable to measure the effect of treatments aimed to halt or reverse disease progression.

TECHNIQUES AVAILABLE IN THE LAB

Microsurgical methods to induce acute neurodegeneration in experimental animals. Basic methods in structural investigations (light, fluorescent, confocal and electron microscopic and electron tomography techniques) and chemical element determination (energy-dispersive X-ray microanalysis, chemical elemental mapping), sample preparation methods for biological structural research, labeling techniques for molecular imaging and statistical basis of sampling for unbiased quantitative microscopy, derivation of biological relevant three-dimensional parameters from biological tissue, interactive and automatic computer assisted image analysis, image analysis programming languages.

RESEARCH AREA

The recent emergence of the field of systems biology brought a new era in the research of evolution. The novel methods and largescale datasets enable the systematic exploration of the elements of biological systems and the interactions between them. Our group is particularly interested in studying the evolution of metabolism. By measuring the intracellular metabolite levels, that is, the metabolome in different yeasts we can assess how fast metabolism evolves and what are the driving forces behind its evolution. We are also studying the evolution of the metabolic network, that is, how can organisms gain novel enzymes and biochemical pathways to better adapt to the environmental conditions. We utilize this knowledge for strain design by discovering genetic modifications that can boost the microbial production of chemicals with industrial importance.

TECHNIQUES AVAILABLE IN THE LAB

Metabolic network modelling, phylogenetic and comparative genomics methods, bioinformatic analysis of metabolomic and transcriptomic data, statistics and machine learning. Programming in R, Python, Perl and Matlab languages.

RESEARCH AREA

Sarcomeres, the basic contractile units of muscles, are composed of three major filament systems: a filamentous actin based thin-filament array, the myosin motor protein based thick filaments, and a titin based elastic filament system. Grounded on classic electron microscopy studies, the sarcomere is defined as a repeating unit of the myofibril bordered by two Z-disks, which serve as anchoring sites for the oppositely oriented thin-filaments of the neighboring units. The midline of the sarcomere is referred as to the M-line flanked by the H-zone corresponding to the central thin filament-free area and to the head-less area of the bipolar thick filaments. The sarcomeres are extremely highly ordered macromolecular assemblies where structural organization is intimately linked to the functionality of these contractile units. Therefore, precise structural description of the sarcomeres is critical to better understand the mechanisms of muscle development and maintenance. We previously established a single-molecule localization microscopy based approach, which can deliver localization maps of multiprotein complexes with very high precision, virtually attaining single protein size resolution. By combining the tools of *Drosophila* genetics with nanoscopy, we plan to better understand the molecular mechanisms of sarcomere assembly and growth during development.

TECHNIQUES AVAILABLE IN THE LAB

Classical and molecular *Drosophila* genetics, molecular biology, cell biology, cytoskeleton analysis, immunohistochemistry, the basic methods of biochemistry, confocal and superresolution microscopy, behavioral tests, live imaging, digital image analysis.

SZABOLCS PÉTER TALLÓSY

University of Szeged
Institute of Surgical Research

Address: Pulz u. 1., H-6724 Szeged, Hungary

RESEARCH AREA

According to the criteria of “Sepsis-3” consensus conference, sepsis is defined as a life-threatening organ dysfunction caused by a dysregulated host response to infection. Sepsis is still one of the most frequent cause of death in intensive clinical care, so a well-standardized animal model compatible with human symptoms is essential in research. There are many descriptions of the process of sepsis in the related literature, but the microbiological background is a less researched area, despite the fact that sepsis is caused by a polymicrobial infection. Based on the above, only that sepsis model is appropriate, where live microorganisms are used, and for this reason, it is indispensable to describe the microbial profile of the animals, and calculate the initial concentration of the microorganism suspension for the sepsis induction. One of the major problems during sepsis is the disproportion between oxygen transport and use, which necessarily leads to the energy deficiency of the cells, therefore, we the mitochondrial effects of different pharmacons from the therapeutic targets were investigated. In our view, the main target of sepsis can be the supply of oxygen and energy to the body, mitigating the mitochondrial dysfunction, and thus reducing the inflammatory response to severe organ damage. We believe that our therapeutic approaches to mitochondrial dysfunction can improve the condition of septic patients.

TECHNIQUES AVAILABLE IN THE LAB

Our research laboratories are equipped with instruments to identify macro- and microcirculatory changes (hemodynamic computerized data-acquisition and analysis systems, laser-Doppler flowmetry, fluorescence-based intravital microscopy, orthogonal polarisation spectral imaging). Fluorescence confocal laser scanning endomicroscopy technique offers the possibility of acquiring precise in vivo data for histological analysis. A high resolution respirometer is available for examination of mitochondrial function (activities of the components of electron transport chain) and additional laboratory facilities (ELISA) to study inflammatory biomarkers. Animal house and fully-equipped operating theatres are available for surgical intervention of small (rats) and larger animals (minipigs).

RESEARCH AREA

Genomics is the study of the structure and function of genome. The genome sequences of many organisms have now been determined. It has also been described that the mammalian genomes contain approximately 22,000 protein-coding genes, however, they only represent about 1% of the genomes. It has also been demonstrated, that almost the entire genome is transcriptionally active at both DNA strands. More and more results show that the non-protein coding RNAs have a very important role on the regulation of gene expression, on various post-transcriptional processes and on the translation. Our research projects focus on the analysis of various viruses (e. g., Herpes simplex virus, Varicella Zoster virus, Vaccinia virus, etc.). We examine the gene expression profiles and transcriptional complexity of these viruses, and also use them as model organisms for the study of our Transcriptional Interference Network (TIN) hypothesis, which propose a novel layer of genetic regulation, and is based on the interactions between the gene activities via the mechanisms of transcriptional read-through between convergent, divergent and parallel gene pairs. For these, we apply state-of-the-art sequencing and bioinformatics techniques, as well as other cutting edge technologies such as the CrispR-Cas9/dCas9 techniques, with which we generate genetically modified viruses or inducible gene expression. Our group also has bacterial-fungal- and human genomics projects (analysis of the genetic background of major depression, Alzheimer's Disease) by applying exome-, transcriptome-, methyl- and ChIP-seq techniques.

TECHNIQUES AVAILABLE IN THE LAB

We apply a wide variety of standard molecular biological methods and the most modern genomic approaches: DNA and RNA purification, propagation and maintaining various cell cultures, propagation of viruses, molecular cloning (homologous recombination and CrispR technique), PCR,

quantitative (q)PCR, digital (d)PCR, Northern- and Western-blot, fluorescent and confocal microscopy. Next- and third generation sequencing (Illumina MiSeq, Oxford Nanopore MinION): genome-, transcriptome-, small RNA sequencing, analysis of epigenetic changes, preparation of sequencing libraries, bioinformatics and statistics. Pacific Biosciences RSII and Sequel data analysis and bioinformatics.

Laboratory of Cell Physiology

Address: Pulz u. 1., H-6724 Szeged, Hungary

RESEARCH AREA

Dysfunction of epithelial ion transport has a crucial role in the development of several diseases such as acute pancreatitis or cystic fibrosis. Acute pancreatitis is among the most common gastrointestinal disorders worldwide. The disease is generally mild, however, the mortality rate in its severe form is high. Researchers have shown that altered ion transport could be responsible for the pathomechanism of inflammatory pancreatic diseases, however, the exact mechanism is unknown. At present, there is no specific treatment. The aim of my research work is to find new molecular and cellular therapeutic targets and to study the ion transport mechanisms of pancreas related diseases such as acute pancreatitis or cystic fibrosis.

TECHNIQUES AVAILABLE IN THE LAB

Isolation of pancreatic ductal or acinar epithelial cells, establishment of cells cultures, microsurgery techniques, patch clamp. Fluorescent and confocal microscopy. Molecular biology methods as immunofluorescence staining, PCR, RT-PCR, ELISA. Induction of acute and chronic pancreatitis in different animal models in vivo; mice, ferrets, pigs, guinea pigs, enzymatic assays, histological analysis.

RENÁTA TÓTH

University of Szeged
Department of Microbiology

Address: Közép fasor 52., H-6726, Szeged, Hungary

RESEARCH AREA

Besides the bacterial flora, several fungal species are also long-term occupants of the oral microbiota. Among these, *Candida* are the most abundant species. Although the role of the human bacteriota and virome is well characterized, less is known about the composition of the mycobiota, let alone its role in the host. Therefore, one purpose of our project is to examine how do normal oral epithelial cells respond to the presence of commensal *Candida* species. We aim to explore their recognition, the corresponding signal transduction mechanisms and potential effector functions in the presence of various fungal stimuli. Since the last decade, numerous studies report alterations in the diversity of the oral microflora of immunocompromised and cancer patients (e.g. with oral squamous cell carcinoma), allowing the overgrowth of opportunistic pathogenic species (such as *C. albicans* and *C. parapsilosis*). Besides the increased probability of oral candidiasis in these patients, the abnormally altered microbiota might also influence the underlying diseases' progression. In addition to investigating the immune response regulatory effect of normal oral epithelial cells, we further aim to examine the potentially altered immunomodulatory effects of oral squamous cell carcinoma cells and to explore signaling routes that might be associated with tumor progression following fungal stimuli.

TECHNIQUES AVAILABLE IN THE LAB

Establishment/ optimization/ handling of *in vitro* co-infection models to examine fungal infections, using human monocytic, epithelial and murine cell lines and primary cells; phagocytosis and killing experiments; RNA preparation; real-time PCR; ELISA; flow cytometry; metabolic activity; cell adhesion and host cell killing (LDH) assays, live cell imaging. Next-generation sequencing, RNA-seq, micro RNA investigations.

Address: Pulz u. 1., H-6724 Szeged, Hungary

RESEARCH AREA

The extracorporeal circulation (ECC) can be lifesaving in conditions, accompanied by severe acute respiratory or circulatory failure, but the ECC related complications limit the application of the technique, and this reduces the group of patients who can benefit from the ECC treatment. Moreover, the complications frequently affect vital organs (kidney, brain, heart) and as a result long lasting aftercare can be necessary or in case of the most severe cases, it might even cause the death of the patient. Our main purpose is to develop and establish animal models, which will be suitable to the examination of inflammatory processes that play critical role in the pathomechanism of the ECC related complications. The other aim is to develop an innovative treatment method, the trans-oxygenator methane administration to moderate ECC associated complications.

TECHNIQUES AVAILABLE IN THE LAB

Learn about small and large animal models of extracorporeal circulation. Participation in animal experimental work, learn about surgical techniques, macro and microhemodynamic measurements. Methods of data processing, statistical analysis of data. Active participation in human studies of the research team.

RESEARCH AREA

Telomeres are nucleoprotein complexes responsible for the protection of chromosome integrity. Telomeres hide the ends of the chromosomes from DNA repair mechanism to prevent chromosome fusions. Telomeres also buffer the 'end replication problem' by the telomerase enzyme, which can elongate the chromosomes ends. In human somatic cells the telomerase is inactive; the chromosomes are continuously shortening, which results in the senescence of the cells. In tumours however the telomerase is reactivated and provides the possibility of unlimited cell divisions. In our lab we study the mechanisms behind telomerase gene activation in tumours.

TECHNIQUES AVAILABLE IN THE LAB

DNA isolation from different biological samples (bacteria, FFPE tumour samples, urine), agarose gel electrophoresis, cloning methods, enzymatic DNA manipulation techniques, culturing of bacterial or mammalian cells, reporter assay, chromatin immunoprecipitation, PCR based techniques (primer design, high fidelity PCR, nested PCR, PCR mutagenesis, KASP, qPCR), heterologous protein expression and protein purification, PAGE, macromolecule interaction studies (gel filtration, immunoprecipitation, MST).

RESEARCH AREA

Despite of modern therapeutical efforts, brain related pathologies often cause life impairing neurological symptoms. The neurovascular unit plays crucial role in the maintenance of the homeostasis of the central nervous system. Endothelial cells and pericytes are the most exposed to mechanical stresses, therefore their mechanobiology is of primordial importance. Successful colonization of the brain involves active participation of all cellular components of the neurovascular unit. Brain colonization is a multistep process, often enhanced by inflammatory signals. Although several mechanisms were proposed for tumor dissemination, homing and metastatic organotropism little is known about the mechanobiology of this complex process. Our research is focused on structural, morphological and nano-mechanical investigation of cells of the neurovascular unit, using atomic force microscopy combined with Raman spectroscopy. A more detailed characterization and description regarding the mechanobiology of the neurovascular unit points towards development and application of more effective drugs in theranostic of neurological disease.

TECHNIQUES AVAILABLE IN THE LAB

High resolution atomic force microscopy imaging, single cell force spectroscopy and micromanipulation. Vibrational spectroscopy based confocal label free chemical imaging, analysis and automatized manipulation of the obtained data, required image processing methods. Special sample preparation and manipulation methodologies used for high resolution images and spectroscopies.

VIKTÓRIA VENGLOVECZ

University of Szeged
Department of Pharmacology and Pharmacotherapy
Address: Dóm tér 12., H-6720 Szeged, Hungary

RESEARCH AREA

Disorders of epithelial ion transport play an important role in the development of many diseases such as cystic fibrosis or diarrhea. Recent research has shown that altered ion transport may also be responsible for the pathomechanism of pancreatic inflammatory diseases and for the abnormal, metaplastic changes of the esophagus (Barrett's esophagus). The incidence of these diseases is increasing worldwide, placing a huge and costly burden on health-care system. At present, the pathomechanism of pancreatitis or Barrett's esophagus is not completely understood, which makes it difficult to develop effective therapies. The aim of my research work is to examine the role of ion transport processes in the development and progression of these gastrointestinal diseases and to identify therapeutic targets that can be a promising starting point for treating of these diseases.

TECHNIQUES AVAILABLE IN THE LAB

Isolation of primary pancreatic and esophageal epithelial cells, establishment of organoid cultures, cell culture. Confocal and fluorescent microscopy (intracellular pH and Ca^{2+} measurements), functional and morphological examination of mitochondria, patch clamp technique. Molecular biological methods such as immunofluorescence staining, conventional and RT-PCR, Western blot, different cell assays (proliferation, migration, adhesion, cytotoxicity assay). Induction of acute and chronic pancreatitis in animal models, enzyme activity measurements (amylase, trypsin, myeloperoxidase, lactate dehydrogenase), histological studies.

ZOLTÁN JÁNOS VERÉB

University of Szeged
Department of Dermatology and Allergology
Regenerative Medicine and Cellular Pharmacology Research
Laboratory

Address: Korányi fasor 6., H-6720 Szeged, Hungary

RESEARCH AREA

Stem cells present in the human adult body play a crucial role in the maintaining of homeostasis, and in the regeneration of tissues and organs. The loss or alteration of their function have been shown to have an important role in the pathomechanism of certain diseases. Mesenchymal stem cells (MSCs) can be isolated from many tissues and organs, and can be differentiated under appropriate conditions towards osteoblasts, fat cells, chondrocytes, myoblasts, fibroblasts, epithelium and other tissues as well. The MSC is capable of controlling humoral and cellular immune responses to prevent inflammation, tissue and organ rejection. They have an extremely important role in inducing local immunosuppression, in which both T cells and dendritic cells are affected by MSC. Due to their immunosuppressive capacity and their high potential for differentiation they became the most researched objects of regenerative medicine. As cell therapy product MSC able to regenerate the damaged tissues or organs and inhibit inflammatory processes. Our research mainly focuses on the role of mesenchymal stem cells in tissue regeneration, and immunomodulation under healthy and pathological conditions According this knowledge we create artificial tissues, tissue engineered products using 3D bioprinting from stem cells and bioscaffolds. We characterize the biochemical and immunological properties of these bioprinted tissues as well. We also investigate how MSC can participate in tumor formation and metastasis.

TECHNIQUES AVAILABLE IN THE LAB

Isolation of stem cells and progenitor cells from various tissues, *in vitro* and *ex vivo* cultivation of isolated cells. Phenotype analysis of cells is performed by immunocytochemistry and flow cytometry. Gene expression studies using PCR and high throughput gene arrays. Measurement of *in vitro* differentiation assays, wound healing and migration tests by high content screening microscopy. Detection of proteins, secreted factors by Western blots, ELISA and protein arrays. Three-dimensional cell cultures and 3D bioprinting.

SZILVIA VESZELKA

Institute of Biophysics
Biological Research Centre

Address: 6726 Temesvári krt. 62., H-6725 Szeged, Hungary

RESEARCH AREA

Pharmaceutical treatment of most disorders of the central nervous system, including neurodegenerative diseases and brain tumors, is restricted due to the poor penetration of drugs across the *blood-brain barrier*, the major entry route for therapeutic compounds to the central nervous system. The great majority of neuropharmaceutical candidates, hydrophilic molecules, biopharmaceuticals, and efflux transporter ligands have a low permeability across the blood-brain barrier. Biocompatible and biodegradable drug targeting systems, so-called *nanocarriers* hold a great promise. Nanovesicles which can incorporate drug cargos and present on their surfaces ligands for blood-brain barrier endogenous nutrient transporters achieve increased specificity and efficacy for drug delivery across the blood-brain barrier. Combination of such ligands is a novel and innovative idea which could contribute to develop systems for better treatment of central nervous system diseases.

TECHNIQUES AVAILABLE IN THE LAB

In vitro cell culture works, isolation of brain endothelial cells (rat/mouse), toxicity measurements (MTT/LDH tests, double cell nuclei staining, real-time cell monitoring assay), resistance measurement, cell uptake and blood-brain barrier transport experiments, immunohistochemistry, confocal microscopy, scanning electron microscopy, spectrofluorometer measurements. Preparation of nanoparticles, zeta potential and size measurements.

SZENT-GYÖRGYI STUDENTS

"Discovery is seeing what everybody else has seen, and thinking what nobody else has thought."

Albert Szent-Györgyi

Szent-Györgyi Students can become members of the Szeged Scientists Academy after their successful admission. These students have already achieved successes as secondary school pupils at the national OKTV and at various international natural sciences competitions. They are especially interested in medical and health sciences, including medical and biological research, and they hope for a career in the field of scientific activities. They are thoughtful, creative, open-minded people; driven by insatiable academic curiosity.

Szent-Györgyi Students have the opportunity to establish a reliable, internationally recognised and renowned career that rests on a widespread network of international science and research.

Szent-Györgyi Students have the ability to join research groups of domestic and foreign mentors so as to systematically achieve their future goals.

In the academic year of 2019/2020 41 *Szent-Györgyi Students* participated in the Szeged Scientists Academy program.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

In our research, we are currently looking for correlations between the immune recognition of cancer patients and their response to treatments. Human leukocyte antigen (HLA) molecules are outstandingly important in adaptive immunity. These molecules show an exceptional variability, and the different variants can bind a different number of protein-sequences (i.e. different promiscuity). We hypothesize that HLA promiscuity has an effect on response to cancer immunotherapy, and thus could be an important biomarker. In addition to immunotherapy, we also investigate the relation between promiscuity and susceptibility to tumours, autoimmune and infectious diseases. In our laboratory, we analyse large and reliable databases which contain information about thousands of patients. We use up-to-date bioinformatic methods for the statistical analysis of these data.

AMBITIONS AND CAREER GOALS

As a medical student, what I find immensely important is having the most up-to-date information in the field of medicine. The Szent-Györgyi Programme is a great opportunity for me to acquire a deeper insight into the latest research, while also learning to make use of scientific literature and improving my problem solving ability through research work. Additionally, my work can contribute to a deeper understanding of pathophysiological processes and to choosing the most appropriate way of treating them.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Brain injuries as a result of stroke can have devastating effects on the patients' quality of life, and they impose a heavy burden on the health care system. The resultant neurological deficit obviously depends upon the severity and nature of the initial injury, but also upon secondary and progressive deleterious events, such as waves of brain cell malfunction that propagate across the regions surrounding the initial brain lesion. Our research activities focus on various aspects of the pathophysiology of cerebrovascular diseases in experimental models to understand the progression of secondary neuronal injury. Our specific aim is to understand the impact of old age on the severity of ischemic brain injury. This is a highly relevant question, taken that cerebrovascular diseases predominantly occur in the aging population. We rely on a new and powerful experimental strategy: real-time imaging of fluorescent tracers in combination with blood flow imaging to show how spreading depolarization, cellular biochemistry and perfusion evolve within the affected brain region. Our findings are expected to help identifying novel treatment targets in stroke.

AMBITIONS AND CAREER GOALS

I would like to contribute to an important discovery in neuro- and cerebrovascular physiology during my carrier. Furthermore, I would like to be acknowledged by other researchers working in my field of science. My main motivation is to produce scientific results which can lead to the development of more effective therapies and techniques.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

ADP-ribosylation is one of the first posttranslational modifications appearing at the site of DNA damage. There, it causes the loosening of the chromatin structure, and has effect on various DNA repair proteins, gene expression and RNAs, too. Small-molecule inhibitors of ADP-ribosylation are now used in the treatment of certain types of cancer. Our goal is to further characterize the role of this posttranslational modification in DNA damage repair. In particular, we focus our research on oncogenic mutations which could be effectively treated with ADP-ribosylation inhibitors. Therefore, new possibilities could be found in the therapy of certain cancer types.

AMBITIONS AND CAREER GOALS

Cancerous diseases are among the main causes of death. Thus, understanding the development of tumours and their functional mechanisms is an important aim of biomedical and molecular biological research. Exploring these questions is necessary for medical treatment. Although I am not a medical student I believe I can participate in the development of this research field as a molecular biologist.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Our research group specialises in researching the electrophysiological and pharmacological properties of the heart. We mainly focus on the spontaneous activity of the heart, Ca^{2+} - homeostasis; sudden cardiac arrest related research on athletic heart syndrome models. In our laboratory we conduct research on rabbit and dog models, both on tissue samples (conventional microelectrode technique) and on individual cells (patch-clamp). My main research involves the spontaneous activity of the sinus node: Ca^{2+} - homeostasis, sodium-calcium exchanger, small-conductance calcium-activated potassium (SK) channels. SK channels have a significant role in neurons, and due to the fact that they create a direct connection between the intracellular calcium handling and the repolarisation of the cell membrane, their role in the cardiac tissue could also be important. However, there is no consensus in the literature on the extent of their contribution to cardiac repolarisation. Because both the Ca^{2+} - homeostasis and the repolarisation are related to arrhythmias, SK channels could potentially have a major role pathophysiologically and pharmacologically.

AMBITIONS AND CAREER GOALS

My ambition is to become a successful doctor and to continue with research. Furthermore, my goals are to earn a PhD and other degrees. The amount of knowledge given to us by the programme, the publications and the scientific conferences all contribute to achieve these goals.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Pathogens seem invariably to attempt to survive the immune system of the invaded host or the pressures of applied therapies. During this accommodation process, DNA-level changes and mutations occur in the cells. These invisible, but important evolutionary processes lead to one of our biggest clinical challenges: antimicrobial resistance. Thanks to scientific advances of recent decades, it has become possible to manipulate the DNA in a precise manner, which enables a rapid and targeted examination of these very mutations. This approach offers a breakthrough in the investigation of antimicrobial resistance. In our work we use the toolbox of evolutionary genome engineering and try to predict preclinically how resistance can evolve against an antimicrobial. A technique developed in the laboratory of my mentor, Csaba Pál, makes the rapid examination and manipulation of evolution possible with unprecedented accuracy. Our aim is the further development and utilization of this method. We also strive to be able to fully understand the evolutionary processes of accommodation, and this way to develop more resistance proof antibiotics.

AMBITIONS AND CAREER GOALS

During my university years I would like to study the field of molecular and synthetic biology and evolutionary genome engineering in as much depth as possible in order to be able to master and develop clinical applications with a special emphasis on the problem of antimicrobial resistance. As a member of the Szeged Scientists' Academy, my aim is to better myself not only in my academic skills, but also to become an open-minded research scientist ready to explore new ideas. In further stages of my career, what I hope to do is not only to follow in the footsteps of other great minds but rather to shape science myself.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Sepsis is one of the biggest challenges in medicine because of its rapidly proliferating nature. On account of the complexity of its pathomechanism, sepsis is hard to diagnose, and amongst the countless therapeutic possibilities used, there is no perfect solution yet. A common feature of septic multiorgan failure (MOF) is microcirculatory dysfunction, which leads to tissue hypoperfusion, mitochondrial dysfunction and necrosis. Thus, microcirculatory-mitochondrial resuscitation seems to be a promising therapeutic target. In our previous studies we have shown that the selective modulation of the endothelin-1 (ET-1) receptors – the most potent vasoactive agent of the body – can be a therapeutic solution for sepsis on macrohemodynamics, microcirculation and mitochondrial respiration too. Nevertheless, it is unknown if the proven mechanism is a direct or indirect effect on mitochondria and if it has any advantages compared to the today used inotropic therapies.

AMBITIONS AND CAREER GOALS

In this project my first goal is to learn in vivo techniques which I can perform on rodents and minipigs. I am interested in the technique of high-resolution respirometry (Oroboros O2k), which is a useful tool to investigate mitochondrial functions. I would like to expand both my theoretical and practical knowledge, which I will be able to use either in medical research or in medical practice.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

HLA molecules are essential in immune recognition, because they present short peptides to T cells. HLA-encoding genes are the most variable ones in the human genome. Using bioinformatics, we investigate the possible relationships between the peptide binding properties of different HLA variants and certain diseases (e.g. different tumours). We also aim to explain the molecular background of these associations.

AMBITIONS AND CAREER GOALS

After the current Bachelor's degree, I would like to continue my Master's degree and then to obtain a PhD degree. After graduating, I would like to join an international research team at a Hungarian university or research institute.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

There is a pressing need for opening up ways for therapeutic macromolecules to the intracellular targets. Certain viral and bacterial proteins are readily internalized in functional form through caveolar endocytosis, but mimicking this process with protein cargos at therapeutically relevant concentrations is a great challenge. Our research group's goal is to target certain gangliosides, as key receptors triggering endocytosis in the caveolar pits, which can internalize large cargos in functional form without degradation. Previously, we identified a pentapeptide sequence that specifically captured the glycan moiety of a ganglioside. The peptide-tag facilitated caveolar endocytosis of proteins so that the cargo-loaded caveosomes did not fuse with lysosomes. An immunoglobulin G complex (580 kDa) was successfully delivered into live HeLa cells at a low nanomolar extracellular concentration, and the escape of the functional cargo protein to the cytosol was observed. Our current work focuses on the intracellular delivery of proteins with a specific function into knock-out cell lines, restoring cell physiology. Instead of fluorescent detection, we express the protein, decorate it with our peptide-tag, then we perform functional tests on the human cells.

AMBITIONS AND CAREER GOALS

During my work I would like to learn as many molecular biological methods as possible especially the techniques with DNA and proteins which are the keystones of molecular biological researches. Furthermore, our research group's aim is to develop a drug delivery technology which can be a milestone in the application of protein-based drugs. My personal aim in the Scientists Academy is to acquire significant theoretical and practical knowledge which can not be learnt elsewhere and become a professional who is effective in clinical work and science alike.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Acute pancreatitis is one of the most frequent gastrointestinal diseases that calls for an acute treatment in a hospital, and its mortality rate in serious cases may reach 30-60%. Despite this, a specific treatment still has not been found, which makes the identification of new drug targets urgent. In an earlier study we showed that the damaged function of the cystic fibrosis transmembrane conductance regulator (CFTR) chloride channel decreases pancreatic ductal bicarbonate secretion. We also suggested that decreased secretion significantly increases the severity of pancreatic inflammation. In my present research my aim is to correct the function of the CFTR channel during acute pancreatitis, which might later prove to be a special treatment option in curing AP.

AMBITIONS AND CAREER GOALS

During my research carrier I would like to focus on the identification of basic mechanisms that can be used in clinical practice. With my results I would like to improve the effectiveness of clinical treatments and the life quality of patients suffering from inflammatory diseases.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Most of the malignant proliferations that affect the central nervous system are of metastatic origin. The evolution and progress of cancer metastasis is a complex and not entirely understood process. One crucial condition is that tumor cells must get through the blood-brain barrier. Part of the neurovascular unit the first defense line is the blood-brain barrier, which allows transfer of nutrients and prohibits the entrance of harmful substances. Structural, morphologic and nanomechanical analysis of cells that form this unit constitutes the central theme of my research work, based on methods of atomic force microscopy complemented with Raman spectroscopy. Direct measurement of intercellular adhesion and affinity can bring us closer to the understanding of this phenomenon, which offers pharmacological and therapeutic possibilities.

AMBITIONS AND CAREER GOALS

During my university studies i would like to aquire medical knowledge as extensive as possible in the interest of offering the best care to the patients. I would like to accomplish this goal through my research and practical medical application both domestically and abroad.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

I have always been interested in Natural Sciences, I knew from the start that I wanted to do research later. I have always been amazed by the complexity and mystery of the human body: understanding how it works from the smallest parts to the whole is one of the most interesting questions I know.

The Szent-Györgyi Research Program gave me an opportunity to join the skeletal muscle adaptation research group of the Department of Biochemistry. The institute follows the muscle research traditions of the Szent-Györgyi school. The aim is to understand the molecular mechanisms of the skeletal muscle regeneration and adaptation, and our findings could have clinical applicability later.

AMBITIONS AND CAREER GOALS

During my medical career my primary aim is to become a good doctor and meet the highest scientific expectations. While researching, I am eager to use my obtained knowledge and also widen my scientific perspective. I believe it is desirable to begin the scientists' and doctors' lifelong learning as early as possible.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Ischaemic stroke is the third leading cause of death among the Hungarian population. The presence of recurring spreading depolarisations (SD) and impaired neurovascular coupling under ischemic conditions significantly decreases the perfusion of the injured area resulting in neuronal cell death and spreading of the infarcted lesion. The aim of our research is to restore the function of neurovascular coupling and to prevent the damage caused by SDs using a new, non-invasive, targeted drug delivery system, thus providing a new therapeutic opportunity in stroke treatment

AMBITIONS AND CAREER GOALS

During my medical career I would like to work in the field of radiology (neuroradiology) as this field serves as the basis of almost every clinical diagnosis and treatment and also provides me an opportunity to invest my acquired knowledge both in research and patient care. In addition, radiology is a rapidly and dynamically developing area, where it is always a requirement to follow and learn new techniques.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

With modern sequencing technologies we are able to make structural and functional examination of living organisms and viruses, thus we can understand better the role of the present genes and non-coding sequences and their effect on each other. The main focus of our research group includes the genomic analysis of various human and non-human pathogenic viruses by using state of the art genome- and transcriptome sequencing methods (long- and short-read sequencing approaches). The gained genomic data is processed with the help of bioinformatical programs. Also we generate genetically modified viruses by using the CrispR-cas9/dCas9 - which is a state of the art genome editing technology capable of making very precise changes - methods for the evaluation of the effect of the gene modification on the global transcriptome.

Our major goal is to describe the static and dynamic transcriptome profiles of these viruses, and to apply them as model organisms for the study of the Transcriptional Interference Network (TIN) hypothesis proposed by our group.

AMBITIONS AND CAREER GOALS

As a medical doctor I want perform medical practice and research side by side, for which this program gives the best bases. My goal with my research is to gain theoretical knowledge and practical experience which will help me in my career which hopefully will lead me to be able to help others. During my career besides finishing medical university, I also want to reach academic degree in which the Szent-Györgyi program provides help.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Anxiety and depression are responsible for one of the largest societal and individual burdens amongst neuropsychiatric disorders, and in many cases drug treatments cannot maintain an asymptomatic state. Former investigations have shown that the mechanism of the transformation of concrete fear reactions into generalized anxiety is similar to that of learning, although the exact neuronal mechanisms in the background are still unknown. Successful animal experiments and clinical investigations have proven that depression and anxiety can be made asymptomatic by means of electrical stimulation. This effect is rather diffuse, though. The aim of my work is to explore the neuronal networks and cell-type specific chokepoints which are responsible for the efficacy of electrical therapies.

In our experiments we use different transgenic animal models in which cell-type specific optoproteins are expressed, making their selective excitation or inhibition feasible. Fear reactions are evoked by using *lege artis* electrical footshock, and we attempt to prevent their generalization into anxiety with optical stimulation. The efficacy of the stimulation is evaluated by measuring the level of anxiety after re-exposure to a similar environment with standard psychophysiological methods (e.g. freezing). The long-term goal of my work is to develop non-pharmaceutical methods to treat drug-resistant anxiety and post-traumatic stress disorder.

AMBITIONS AND CAREER GOALS

After obtaining my medical degree, I would like to become an internationally recognized physician and researcher. Naturally, I intend to earn a PhD and a postdoctoral degree, too. In order to acquire some professional experience, I hope to be able to work abroad as a member of an international team, possibly in the US or the UK.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Studying the human metabolome is necessary for the future of medicine. By understanding it, we can identify new biomarkers, find key molecules in the pathophysiology of diseases and even understand the healthy human body better. As the mapping of the human metabolome only started in the last couple of years we have not yet understood this system in details. We do not know what polymorphisms the healthy human metabolome shows on the population level. We do not know which metabolic alterations are eliminated by natural selection. Furthermore, we do not know the relation of these to disease conditions. In our project we compare pre-existing dataset from previous publications in order to answer the questions above and to understand the mechanisms and evolution of the human metabolome better.

AMBITIONS AND CAREER GOALS

I aim to study the fields of data science, statistics and computational biology further in order to participate in international research projects which contribute to the development of evidence based medicine.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

For the physiological functioning of the central nervous system it is inevitable to maintain a constant internal environment in which the so-called neurovascular unit plays a pivotal role. Damage to this defence system can lead to the development of or can aggravate various serious diseases affecting the central nervous system. Pericytes have been attributed a prominent role in the pathophysiology of age-related brain pathologies including ischemic stroke, particularly in the production of abnormal vasoconstriction, which may impede the maintenance of normal cerebral circulation.

As there is currently no clear evidence that pericytes are responsible for pathological vasoconstriction, in the research group we set out to investigate the structural changes and molecular mechanisms that may be involved in this process using *in vivo* two-photon microscopy imaging and *ex vivo* techniques. Our expected results may shed new light on the active role of blood-brain barrier elements, particularly the pericytes, in the pathomechanism of age related brain diseases, and may lead to the discovery of new therapeutic targets in the future.

AMBITIONS AND CAREER GOALS

As a Pharmacy student, I feel that the Szent-Györgyi program offers a unique opportunity to master both research and pharmacy skills. After graduating from the University, I would like to join a doctoral school and obtain a PhD while also working as a scholarship holder at famous foreign laboratories. Finally, I would like to use my experience in independent research projects as a neuroscientist.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Throughout the last few decades, invasive fungal infection has been posing a growing threat to patients with a suppressed immune status in hospital environments. Species from the genus *Candida* are frequently isolated from such infections, and among them it is *Candida parapsilosis* that threatens neonates most and is thus in the centre of our attention. In our research we aim to better understand the interaction between fungal cells and the host by investigating immune responses. We intend to examine pathogen recognition and potentially activated signal transduction pathways in a healthy mucosal environment during *C. parapsilosis* interaction by using various approaches. These include the investigation of the role of pattern recognition receptors (PRRs) in the immunological recognition of *C. parapsilosis* as well as the activated signal transduction pathways, which lead to the development of immunological tolerance. Our further ambitions include finding yet undiscovered mechanism involved in the discrimination between elimination and tolerogenic responses induced by fungal species as we hypothesize that these mechanisms might contribute to the progression of other, non-microbial diseases as well.

AMBITIONS AND CAREER GOALS

During my scientific career I aspire to acquire a deeper insight into immunology in order to fully understand the bases of fundamental immune responses, for which the understanding of host-pathogen interactions is absolutely necessary. As a member of the *Candida* research group, my long-term goal is to contribute to the expansion of our current knowledge on commensal and pathogen microbe-induced immune responses.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Our research group has demonstrated for the first time that normoxic methane (CH₄) ventilation protects the tissues by mitigating the effects of an ischemia-reperfusion IR insult (Boros 2012). These data were validated by independent observers, the anti-inflammatory and anti-apoptotic properties of CH₄-based treatments were repeatedly demonstrated and the evidences now suggest that CH₄ can have biological and/or signaling functions in vivo in mammals. In the "in vitro" branch of our research project we characterize the mechanism of action of CH₄ in the evolution of hypoxic cell injuries on neonatal rat cardiomyocytes, with special emphasis on biological membranes, as non-specific targets. The effects of CH₄ on cellular and subcellular components, including mitochondria is tested on isolated cardiac mitochondria. Complex effects of IR injury focusing on specific organ functions, is investigated in "in vivo" animal models. Our further aim is to outline a new CH₄-based approach for organ preservation, and to develop a solution supplemented with biologically active gases to achieve better results in clinically-relevant organ storage models.

AMBITIONS AND CAREER GOALS

Right after finishing my studies, I will apply to the Ph.D. program of the University of Szeged. During my Ph.D. studies I would like to acquire international experience. I have a strong interest in autoimmune diseases and I am considering specializing in pediatrics after getting the Ph.D. qualification.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

The existence of membrane contact sites, i.e. permanent physical contacts between organelles of eukaryotic cells has been known for a long time, however, understanding their functions has just begun during the last decade. The most well-characterized function of these contacts is enabling lipid transport between the contacting organelles. Interestingly, recent studies shed light on the direct role of such contacts in the endosomal system as well. During our work, we aim to investigate the function of Snx25, a known membrane contact site protein, which is involved in a human hereditary neurodegenerative disease, a distinctive type of spinocerebellar ataxia. Our results show that the mutation of the fruit fly (*Drosophila melanogaster*) counterpart of this gene leads to severe defects in the endosomal maturation process of the highly endocytic larval nephrocytes. As the exact mechanism of this phenomenon is currently not known, we aim to decipher the role of the *Drosophila* Snx25 protein in endosomal maturation using genetics and light-microscopy and our self-maintained fruit fly stocks' nephrocytes as an experimental model system.

AMBITIONS AND CAREER GOALS

My primary aim is to match the medical and scientific work. In my opinion through knowledge in all natural sciences, especially in regards to modern biology is essential to understand and discover the most effective therapies. In the near future I would like to work in the fields of genetics and cell biology. Later I intend to continue this work during my PhD study, and my task in inland and foreign laboratories in addition to my medical studies.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

More than 422 million people have diabetes worldwide, with more than 1 million people dying each year as a result of diabetes. The incidence of diabetic complications, e.g. macro and microangiopathies, lower limb amputations, chronic renal failure, retinopathy is constantly increasing. Although the effects of diabetes on most organs are well characterized, there is still a lack of information on the pulmonary effects. We examine patients undergoing elective open-heart surgery (more than 700 patients per year in Szeged) in a prospective consecutive way. The mechanical properties of the respiratory tissue and airway compartments are assessed using the forced oscillation technique (FOT). This method has the advantage of not requiring patient effort, therefore it can be used during surgical anaesthesia. Our main goal is to detect changes of the respiratory system related to type-2 diabetes mellitus to allow for a more specialized anaesthetic care of these patients. Our other objectives include investigating effects of chronic dust and textile particles exposure to the respiratory system by using the same technique and exploring the influence of ultrafiltration on the systemic inflammatory response following cardiopulmonary bypass.

AMBITIONS AND CAREER GOALS

Apart from clinical work, I would like to continue research in a subject related to my future specialization because I am determined to find out exactly what causes diseases in humans. With my research I intend to serve my future patients and medicine in general at the same time.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

According to WHO, one in every 6 people's death (a total of 9,6 million deaths in 2018) is due to cancer, making it the second leading cause of death globally. In most cases, the cause of failure in pharmacotherapy is originated in the tumor's apical development of resistance against cytotoxic agents, which is also called as multidrug resistance (MDR). This issue is unsolved to the present day, which calls for an urgent need for a radically new approach in enhancing our strategies.

Ecdysteroids are analogs of ecdysone, a moulting hormone of arthropods, that are non-toxic and bioactive in mammals. Some of their less polar derivatives combined with a certain chemotherapeutic agent have a strong chemo-sensitizing effect on both drug susceptible and MDR cancer cell lines. The main goals of our research are the identification and semisynthetic chemical modification of new and promising lead molecules (e.g. production of fluorine substituted derivatives and their self-assembling nanostructures), as well as defining their pharmacological potential.

AMBITIONS AND CAREER GOALS

As a medical student I would like to represent the level of quality this profession requires both in my academic studies, and in my research. Apart from improving my cooperating and problem solving ability, research also provides me with an important support in leading me in the scientific literature, which sufficiently supplements my academic knowledge with comprehensive and up-to-date information. I also hope that our work can lead to results that can emerge as useful help in therapy.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Nowadays cancer is the leading cause of death in economically developed countries. The contraction of cancer can be considered as an evolutionary process within our bodies. The tumor genome sequence data collected so far show that there are tens or even hundreds of thousands of mutations in each tumor sample, and the spontaneous mutation rate observed in normal cells is not sufficient to account for the high number of mutations found in cancers. However, it is this very instability of their genetic material that may allow cancer cells to generate an enormous number of mutations. The long-term objective of our laboratory is to explore genetic alterations fueling malignant transformation by undermining the stability of the genome.

AMBITIONS AND CAREER GOALS

After obtaining my MSc degree, I plan to continue my studies and my research work as a PhD student. By earning my PhD degree, I would like to master a broad range of molecular biological techniques and their biological bases. As a postdoctoral researcher, I hope I will have the chance to spend some years abroad in order to be able to gain some professional experience before I can establish my own research topics and head my own research team. I am particularly interested in biotechnology and so very eager to further improve the currently available biotechnological toolbox.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Early recognition is one of the most important factors in successful treatment of cancer, which ideally can be achieved through non-invasive or minimally invasive way. In case of bladder cancer, tumour cells appear in the urine, from which DNA could be purified and analysed to detect mutations specific to cancer. Mutation hotspots are in oncogenes and among them in the promoter of the telomerase reverse transcriptase, which is responsible for DNA elongation at the ends of chromosomes. The telomerase is active in embryonic cells but inactive in somatic cells, therefore the telomeres of the latter are progressively shortening, with each cell division, until they are critically shortened, that results senescence. In tumours, however the telomerase is often re-activated, therefore these cells become immortalised, so they can endlessly divide. In most cases telomerase reactivation is due to mutations at hotspots in its promoter. Our aim is to study telomerase promoter mutations in order to get answers for the following questions: Under what circumstances do the mutations appear? At which stage of carcinogenesis / tumour progression do telomerase promoter mutations appear? Is there any correlation with mutation types, appearance and bladder cancer subtypes? How do the mutations affect the course of the disease? Our long-term goal is to develop a PCR-based, simple and cost-efficient rapid test to detect the presence of potentially cancerous cells from urine targeting telomerase promoter mutation and other tumour markers.

AMBITIONS AND CAREER GOALS

I would like to improve my knowledge continuously in order to become as good researcher and physician as I can. With my work I hope to contribute to the advance of society that I consider the most important goal one can aim at.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

I have been interested in medicine since high school, and have always been keen on the workings of the human body, especially the human brain. Parallel with my university studies, the Szent-Györgyi Program provided an opportunity to participate in research on this topic. By joining the interdisciplinary work of the Neuroimaging Research Group, I have the opportunity to learn about the use of imaging methods in various neurological conditions. The main profile of the lab is using magnetic resonance imaging (MRI) as a biomarker to track the course of disease and to identify underlying pathological processes, employing modern image analysis and statistical methodology. In our current project, we use functional magnetic resonance imaging (fMRI) to characterize hemispheric lateralization via network-based analysis techniques.

AMBITIONS AND CAREER GOALS

During my university studies, I would like to acquire as wide a range of medicine and multidisciplinary knowledge as possible by engaging in as many international scientific projects as possible, where I can acquire practical skills. After finishing my studies, I would like to apply my knowledge both in research and clinical work.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Sarcomeres are the basic contractile units of muscles. They are composed of three major filament systems: the filamentous actin based thin filament array, the myosin based thick filaments and the titin based elastic filament system. The structure of sarcomeres has been well characterized, leading to quasi-atomic models of thin and thick filaments. However, the exact spatial arrangement of many of the major muscle proteins remained unknown. In addition, several key aspects of microfilament array formation and dynamics are not yet clarified. Our research group used a Single Molecular Localization Microscopy system to collect images of *Drosophila melanogaster* flight muscle sarcomeres, which are highly similar to the striated muscles of vertebrates. Our group also created a nanoscopic protein localization atlas, which includes 22 muscle proteins. Our studies were so far focused on the muscles of 1 day old adult specimens, however, to obtain developmental insights, it is necessary to examine both earlier and later developmental time points, in order to map the distribution of proteins during the actively elongating phases of sarcomere development, as well as in mature or ageing muscles. Our aim is to better understand how sarcomeres are organized and get assembled during sarcomerogenesis; to determine the position of novel muscle proteins; to test the predictions of our new I-band and H-zone model and to probe the evolutionary conservation of the fruit fly protein distribution data in mouse myofibrils. These pieces of information are indispensable in order to understand the details of sarcomere assembly and function in healthy and in disease conditions.

AMBITIONS AND CAREER GOALS

During my research, I would like to acquire as much methodological and theoretical knowledge as possible, which can be helpful in my further work. I find it important to have a greater insight into the research work during my university years, which will help me make decisions about my long-term plans. After graduating with my MSc degree, I would like to get a PhD degree and then work as a researcher.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Our research group is mainly interested in acute and chronic neurodegeneration. In our current experiments, we have been investigating motor neurons and their neighboring non-neuronal cells, such as Schwann-cells during acute neurodegeneration. In the field of chronic neurodegeneration, we focus on amyotrophic lateral sclerosis and its pathobiology and our main goal is to find possible therapeutic approaches.

AMBITIONS AND CAREER GOALS

In the course of my scientific career I would like to investigate the complex interactions of different factors leading to motor neuronal degeneration. My aim is to gain proper knowledge that can serve the human society and medical science. I hope it will give me a possibility to contribute to the development of novel therapeutic strategies.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Amiotrophic lateral sclerosis (ALS) is a neurodegenerative disorder which cannot be cured efficiently up to this day. ALS significantly decreases the quality of life of the patient and leads to death 3-5 years after the diagnosis. There are two forms of this disorder: familial and sporadic. Through sequencing the genome of patients scientists have been able to detect genetic variants that might be responsible for the development of ALS. The aim of our research is to further investigate the genetic background of amyotrophic lateral sclerosis through the genetic analysis of Hungarian patients affected by ALS. The knowledge of the genetic background of ALS could provide an opportunity to develop efficient diagnostic techniques and personalized therapy.

AMBITIONS AND CAREER GOALS

After finishing medical school, I would like to get my PhD degree. I intend to work overseas or somewhere in Europe, and I wish to pursue a career in research as a full-time scientist.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Tissue hypoperfusion and hypoxia due to circulatory or respiratory insufficiency are usually severe conditions which are often difficult to treat in the clinical practice. The decrease in tissue oxygen supply may initiate mitochondrial dysfunction leading to defects of electron transport, ATP synthesis and calcium homeostasis. As a result of oxido-reductive stress, intracellular calcium overload may occur which leads to opening of mitochondrial permeability transition pore (mPTP), non-selective calcium release and apoptosis. Certain biologically active gases (e.g. nitric oxide) were shown to influence hypoxia-reoxygenation injuries via mPTP inhibition. Our research project is focused on the effects of methane inhalation on mitochondrial calcium uptake and release in a rodent model of hypoxemic hypoxemia.

AMBITIONS AND CAREER GOALS

I hope my research career will eventually amount to a PhD degree, and I would like to live to see methane used in clinics as a bioactive gas in decreasing IR injuries.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Our research group studies the etiology and the complex pathomechanisms of neuronal degeneration and other malicious events which can lead to neuronal death. Amongst degenerative diseases that take place in the central nervous system we focus on amyotrophic lateral sclerosis, one of the most common pathological conditions that can be characterized by the progressive loss of motor neurons. Our aim is to reveal and understand the complex pathological mechanisms from the level of the nervous circuits to the level of a single motor neuron as well as to find possible therapeutic approaches.

AMBITIONS AND CAREER GOALS

As for my scientific approach, I share my mentors' point of view that a scientist must sit down to a microscope and stand next to a patient with the same determination and enthusiasm, because in both cases the most important is to give hope to the people who suffer from the disease.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

The goal of our research group is to develop a novel drug delivery system that is capable of transporting therapeutics into the central nervous system. Most drugs cannot enter the brain via the bloodstream because of the so-called blood-brain barrier. Therefore, central nervous diseases, such as Alzheimer's disease, Parkinson's disease and brain tumors, are extremely challenging to treat pharmaceutically.

We would like to solve this problem with "nanosized Trojan horses", uniquely designed nanoparticles. These are small vesicles, not visible for the naked eye. We load the drugs inside the nanoparticles and coat their surfaces with special targeting molecules. These targeting molecules are then specifically recognized by the blood-brain barrier and can enter the brain with the drugs inside of them.

AMBITIONS AND CAREER GOALS

After my Master's I would like to continue biomedical research as a PhD student. As a scientific researcher I would like to find solutions to relevant problems and have results that could make the quality of lives of people better.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Magnetic Resonance Imaging (MRI) is a diagnostic tool, which is useful in fundamental research as well. Because it is a non-invasive procedure, it can be used in wide range of cases with only a few exceptions. Beyond the structure of the brain, functional networks could be investigated with MRI. This widely used tool in clinical neuroscience is applied in various diseases such as multiple sclerosis and migraine. Migraine is the most frequent neurological disorder in adults, affecting up to 12% of the general population, primarily women. Its origin and pathomechanism are unknown, but functional and structural differences in migraine patients' brain are detected. This knowledge can be helpful to develop more efficient therapies. Moreover, through understanding of the background of the disease we can get closer to the understanding of the human body's pain processing. The focus of my research project is the alteration of functional networks and their association with clinical data in migraine. This can lead us closer to the understanding of this disease.

AMBITIONS AND CAREER GOALS

During my studies I would like to get to know most fields of medical science and to be able to acquire knowledge which is essential to be a good physician. I would like to gain experience in Hungary as well as abroad to become more effective in my profession. I think it is important not only to care about the present status of medical science but also to build its future as a researcher. For a doctor life-long learning is a really important task, but not only from the books also from the nature.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

The way we perceive and process information and inputs from our environment is unique to us, humans and still most of the mechanisms which enable us to perform complex and abstract thinking are yet to be discovered. In Tamás Gábor's Research Group for Cortical Microcircuits we seek to unveil the underlying elementary mechanisms of this process on the level of synapses and neural microcircuits and the functions of different cell types in rodent and human cortical cortex. We have the excellent opportunity to compare the functions of the commonly used model animals' brain with ours by performing in vitro patch clamp in non-pathological human brain slices among other electrophysiological techniques. Our primary focus is on the role of inhibitory interneurons in such networks.

AMBITIONS AND CAREER GOALS

I endeavour to exploit the opportunities offered by Szent-Györgyi programme, broaden my understanding and learn new methods. It is of great importance to me to keep up with the developments and findings of neuroscience, and to acquire up-to-date, applicable knowledge not only in the fields of neurobiology and electrophysiology but also in borderline sciences. I want to become a useful member of a research group and be able to contribute to the development of my field of expertise.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Basically, we investigate the mechanism of gene expression using the most modern tools and technologies in several viruses. Virus models can be used to investigate transcriptional and translational regulation and the role of non-coding sequences in the genome. Our tools include the CrispR-Cas9 / dCas9 genetic engineering technique, which is one of the most modern methods to modify the genome. Our research topic is very important, because knowing the exact operation of the genome we could treat diseases and disorders with great efficiency. In addition, this knowledge could be applied in the industry, as we could create more resilient plants and animals that yield more products. Currently, our research focuses on the Transcription Interference Network (TIN) hypothesis.

AMBITIONS AND CAREER GOALS

During the MSc course I would like to learn bioinformatics, and after graduation I plan to apply for a PhD course, where I can learn to research independently. In the future, my goal is to work at such a level that I can become a recognized researcher.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Numerous endogenous and exogenous agents can cause DNA damage, which may lead to deleterious consequences. The response to DNA damage is the activation of DNA damage sensing proteins and DNA repair mechanisms. DNA repair mechanisms and DNA damage tolerance are required for the correction of DNA damage occurring during normal cellular life or due to physical or chemical agents. Autophagy is responsible for the breakdown and recycling of damaged cellular components. There are evidences that the two processes are connected, and they can regulate each other. In MCF-7 cells BRCA1 negatively regulates autophagosome formation and lysosomal acidification and different Fanconi anaemia proteins may play role in the mitophagy regulation. But they didn't figure out the exact regulatory mechanisms...

In the scope of our work we attempt to evaluate the role of selected DNA repair genes in the regulation of autophagy in human cell culture with molecular biology and microscopy based methods.

AMBITIONS AND CAREER GOALS

My principal goal is to master genetics at the highest level possible and to impart my knowledge to others. I also intend to expand my expertise by working in leading research labs abroad. Also I would like to use my genetics knowledge in the medical oncology field.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Stroke is the third most common cause of death in Hungary and Europe coming only after heart disease and cancer. Recurrent spreading depolarizations (SDs) spontaneously occur in the cerebral cortex after experimental induction of focal ischemia. SDs generate consistently and repeatedly in the injured human brain for at least over a week after the initial trauma, and contribute to lesion progression by worsening the perfusion of penumbra tissue. The central goal of our research is to understand the mechanisms that mediate the SD-coupled cerebral blood flow response and SD related neurodegeneration. Ultimately, we aim to identify targets to counteract the evolution of injurious spreading depolarizations and limit the progression of secondary injury. Our methodological approach includes classic electrophysiology, the use of ion selective microelectrodes, cerebral blood flow monitoring, and novel, experimental, optical neuroimaging.

AMBITIONS AND CAREER GOALS

I would like to use the experience and knowledge that I acquire during my work, regardless of whether I will be working in fundamental research or clinical research, After finishing the university I would also like to start working on my PhD degree.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Importance, aims and possible outcome of research:

Members of the genus *Candida* are the most common opportunistic human pathogenic fungal species that cause nosocomial infections. Although *C. albicans* is the most common cause of candidiasis and thus, the most investigated, the number of infections caused by other *Candida* species is also rising since the last decade. Host responses, enabling an effective clearance of these fungi, originate from the combination of innate and adaptive immune responses.

Nowadays, we have a wide range of information about the innate immune system's responses to the presence of *C. albicans* and *C. parapsilosis*. Based on these, the fundamental difference between these two species is that unlike *C. albicans*, *C. parapsilosis* does not induce strong inflammatory responses. Our laboratory's previous results suggest that *C. parapsilosis*, instead of inducing an inflammatory response, may trigger some kind of tolerogenic reaction. This conclusion was drawn from the fact, that this species' interaction with human mononuclear cells from peripheral blood (PBMCs) resulted in a cytokine response indicating Th2 polarization, instead of Th1 and Th17 differentiation, a response characteristics of fungal infections (especially those caused by *C. albicans*).

In our present work, we aim to examine how *C. parapsilosis* influences the adaptive immune response of the host, compared to *C. albicans*. During this process, purified epitopes specific for these species are used to investigate Th1, Th17, Th2 and T-reg polarization of T-cell populations, the induced humoral immune responses and transcriptomic changes in host cells.

AMBITIONS AND CAREER GOALS

After finishing the BsC and Msc programme I would like to get my PhD degree. As a researcher I would like to contribute to the development of medicalbiology and immunology.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Biotic methane has traditionally been considered as a product of methanogenic bacteria exclusively, but new evidence has shown that eukaryotes can also be enabled to produce methane, usually by causing an oxido-reductive burst with a subsequent mitochondrial dysfunction. The biochemical background of non-microbial methanogenesis is still unclear, but recent research suggests that the presence of organosulphur compounds is essential for this process. It has been brought to light that exogenous methane possesses antioxidant features. The question arises whether we might be able to identify biomolecules with a methanogenic capacity that is suitable for human consumption, and also whether that molecule is able to have a positive effect on the harmful consequences of oxido-reductive stress through methane formation. In addition, the detection of endogenous non-microbial methane generation by means of our laser-based photoacoustic spectroscopy (in collaboration with the MTA- SZTE Photoacoustic Research Group) could be a promising diagnostic approach. Currently we are working on a publication about this project. My further works are also connected to methane; we examine the effect of the soluble form of the gas on cold ischemia during organ transplantation.

AMBITIONS AND CAREER GOALS

After finishing my studies, I would like to work in a hospital as a doctor as I am mostly interested in pediatrics. However, after graduation I am planning to enroll for a PhD course besides my resident training since I am committed to contributing to the progress of medicine with my research work. Also, I firmly believe it is absolutely essential that a professional like myself should facilitate the spread of novel methods in a clinical environment, as well.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

In today's developed world there are few diseases for which there is no effective cure. The gravity of tumour related diseases could be characterised by the fact that it is the second leading cause of death globally: approximately every sixth person dies due to cancer. The current treatments damage healthy cells as well in most cases, in contrast, they are usually not efficient enough against tumour cells.

ATR inhibitors may provide a solution to this: recent research has shown that tumour cells exposed to increased replication stress (RS) are very vulnerable to a decrease in ATR protein levels. ATR is one of the key proteins of the DNA damage response (DDR); and its role is to stabilize the stalled replication fork. In addition to increasing replication stress, ATR inhibitors indirectly force the cell into a premature mitosis that leads to its death.

The aim of my research is the synthesis and examination of previously unknown, expectedly ATR inhibitor antitumor agents. The chemical structure of protoflavones provided the central idea of our work: protoflavones are a rare and special group of natural flavonoids, among which several ATR inhibitors (e.g. protoapigenone) have been found. The impact assessments are not only carried out by the collaborating research groups for ATR inhibition, but for many other impacts. This way we can find other compounds that can be used in several different fields of medicine.

We hope to create a new family of compounds whose most potent members may be well suited for clinical development for tumour therapy and which, in the long term, may lead to the discovery of a first-in-class, effective and safe ATR inhibitor drug.

AMBITIONS AND CAREER GOALS

My goal is to gain as much expertise as possible during my university years and beyond; to help as many people as possible with my research and clinical work. I will strive to improve medicine by developing useful new methods and therapies. Later on, I would love to spend some years abroad to improve my knowledge and gain experience. Besides these, I would like to stay open-minded towards other fields, partially with the help of this programme which offers us first-rate opportunities.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Extra corporal circulation (ECC) is commonly used during several type of heart surgeries and intensive care. During extracorporeal membrane oxygenization (ECMO) or cardiopulmonary bypass (CPB) the lungs are excluded from the circulation and the blood is introduced to a considerable amount of heparin. Furthermore the blood contact with the foreign surface of the CPB circuit causes an immediate inflammatory response similar to the septic systemic inflammatory response (SIRS) in which humoral and cellular factors play an essential role. The contact activation leads to intrinsic activation of the coagulation cascade and further activation of pro-inflammatory cascades, triggering a wide variety of cellular systems. If these cascade activations are dysregulated due to prolonged ECC time and further metabolic changes, significant tissue and organ damage can occur in sensitive organs such as the kidneys and intestines. *In vivo* animal models are used to explore the mechanisms behind these reactions, therefore in the Institute for Surgical Research, University of Szeged, a clinically relevant large animal model is used to monitor inflammatory responses during ECC. Our aim is to investigate the exact mechanism behind the ECC-induced inflammatory reactions along with the development of novel therapeutic strategies to reduce post-ECC inflammatory damage.

AMBITIONS AND CAREER GOALS

As a medical student clinical knowledge and skills are exceptionally important, however I find keeping up with scientific research and integrating them into practice is just as crucial. By working in this laboratory, I would like to deepen my knowledge in the pathophysiology of post-surgical inflammatory response and obtain surgical skills, which I will benefit from later as a practitioner.

IMPORTANCE, AIMS AND POSSIBLE OUTCOME OF RESEARCH

Psoriasis is a multifactorial skin disease affecting about 2-3% of the population worldwide although it is more prevalent in the Caucasian race. The most common form is the plaque type psoriasis, called Psoriasis vulgaris. Psoriatic lesional tissue is characterized by epidermal hyperplasia, abnormal keratinocyte differentiation, intensified and abnormal angiogenesis and inflammatory cell infiltration. The research focus of my group in our laboratory is the pathomechanism of psoriasis. I am involved in investigating the contribution of the extracellular matrix (ECM) components to the development of psoriatic skin pathology. We aim to examine the regulation of ECM genes by using Real-time RT-PCR technology and the expression of ECM proteins with immunocytochemistry and Flow cytometry in a 3D skin model.

AMBITIONS AND CAREER GOALS

By working in this laboratory, I want to learn basic techniques in biomedical research so that later on I can contribute finding new methods in the therapy of inflammatory skin diseases. There are several medicines that cure psoriasis, but many of them are merely symptomatic therapies. A better understanding of the pathomechanisms may lead to more relevant therapies with longer lasting results.
